Appendix A Street Inventory and Condition Summary

Appendix B Street Rehabilitation Program by Segment

Appendix C Street Rehabilitation Program by Year

APPENDED MAPS Located on Thumb Drive

Functional Classification Designation

Pavement Condition Rating by Project

Pavement Condition Index by Segment

Pavement Condition Rating by Segment

Five Year Rehabilitation Plan for $1.525M Budget

Five Year Post Rehab PCI for $1.525M Budget

Abbreviation or Acronym	Definition
$k	Dollars in thousands ($,000)
$M	Dollars in millions
%SP	Percent Spreadability - component of deflection analysis
AC	Asphalt Concrete - asphalt streets, flexible pavements, also known as ACP
ACP	Asphalt Concrete Pavement - asphalt streets, flexible pavements, also known as AC
ART	Arterial roadway functional classification
ASTM	American Society of Testing Methods
Avg	Average
BCI	Base Curvature Index - component of deflection analysis
Brk	Break
CAL	Coarse Aggregate Loss
CDV	Corrected Deduct Value - part of the ASTM D6433 PCI calculation
COL	Collector roadway functional classification
Crk	Crack
DeflCON	Deflection Condition - structural load analysis based on traffic loading and deflection
DMD	Dynamic Maximum Deflection - temperature corrected deflection
Dvdd Slab	Divided Slab
DynaCON	Dynamic Condition - structural layer analysis
ft or FT	Foot
ft2 or FT2	Square foot
FunCL	Functional Classification
FWD	Falling weight deflectometer
GCI	Gravel Condition Index
GFP	Good - Fair - Poor
GIS	Geographic Information System
GISID	GIS segment identification number
H&V	Horizontal and Vertical
IRI	International Roughness Index
Jt	Joint
L&T	Longitudinal and Transverse
LAD	Load associated distress
LOC	Local roadway functional classification - same as RES
LOG	Lip of Gutter
m	Metre or meter
M	Moderate
m2	square metre or square meter
MART	Major arterial roadway functional classification
Max	Maximum
MaxDV	Maximum Deduct Value
MCOL	Major collector roadway functional classification
mi or Mi	Mile
Min	Minimum
MnART	Minor arterial roadway functional classification
MnCOL	Minor collector roadway functional classification
MOD	Moderate
NLAD	Non-load associated distress
OCI	Overall condition index, also known as PCI
Olay	Overlay
PART	Primary arterial roadway functional classification
Pavetype	Pavement Type
PCC	Portland Cement Concrete - concrete streets
PCI	Pavement Condition Index - generic term for OCI
R&R	Remove and replace
RART	Rural arterial roadway functional classification
PWF	Priority Weighting Factor
Recon	Reconstruction
Rehab	Rehabilitation
RES	Local roadway functional classification - same as LOC
RI or RCI	Roughness Index
S	Strong
SART	Secondary arterial roadway functional classification
SCI	Surface Curvature Index - componenent of deflection analysis
SDI	Surface Distress Index
SI	Structural Index
STA	Station or chainage
Surf Trtmt	Surface Treatment
TDV	Total Deduct Value
W	Weak

1.0 PROJECT DESCRIPTION

1.1 PRINCIPLES OF PAVEMENT MANAGEMENT

Nationwide, billions of dollars have been invested in roadway networks by municipal, state, and federal governments. Locally, Huntsville has 155 miles of roadways, encompassing over 2.4 million square yards of asphalt surfacing. At an average replacement cost for a typical roadway just over $783k per mile, not including the value of the land, the City has over $121 million invested in its paved roadway network.

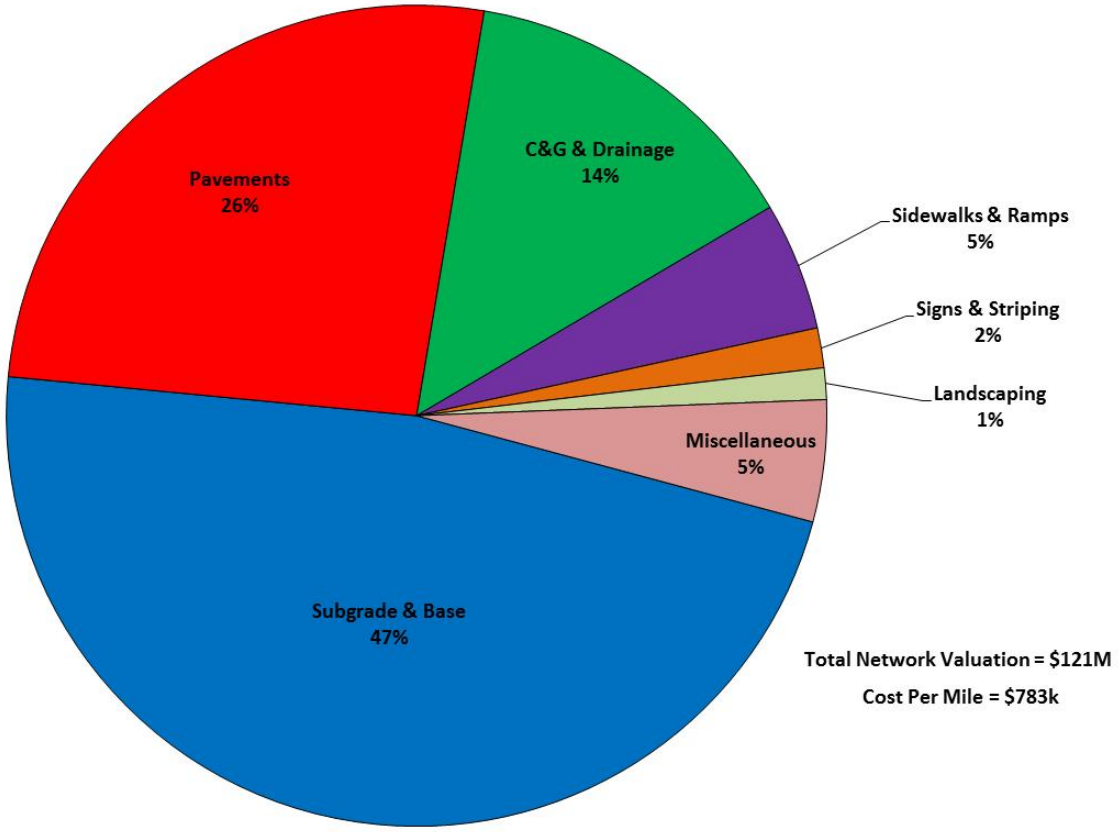

Figure 1 – Replacement Value of Huntsville Paved Roadway Network

Preservation of existing roads and street systems has become a major activity for all levels of government. There is a shortage of funds to maintain street systems at the state and local government levels. Therefore, funds that have been designated for pavements must be used as effectively as possible. One proven method to obtain maximum value of available funds is through the use of a pavement management system.

Pavement management is the process of planning, budgeting, funding, designing, constructing, monitoring, evaluating, maintaining, and rehabilitating the pavement network to provide maximum benefits with available funds.

A pavement management system is a set of tools or methods that assist decision makers in finding optimal strategies for providing and maintaining pavements in a serviceable condition over a given time period.

As shown in Figure 2, streets that are repaired when they are in a good condition will cost less over their lifetime than streets that are allowed to deteriorate to a poor condition. Without an adequate routine pavement maintenance program, streets require more frequent reconstruction, thereby costing millions of extra dollars. Over time, pavement quality drops until the pavement condition becomes unacceptable. For each street, the shape of the curve, and hence, the rate of deterioration, is dependent on many factors – foremost of which being the strength of the roadway structure and traffic loading. The key to a successful pavement management program is to develop a reasonably accurate performance model of the roadway, and then identify the optimal timing and rehabilitation strategy. The resultant benefit of this exercise is realized by the long term cost savings and increase in pavement quality over time. As illustrated in Figure 2, pavements typically deteriorate rapidly once they hit a specific threshold. A $1 investment after 40% lifespan is much more effective than deferring maintenance until heavier overlays or possibly reconstruction are required just a few years later.

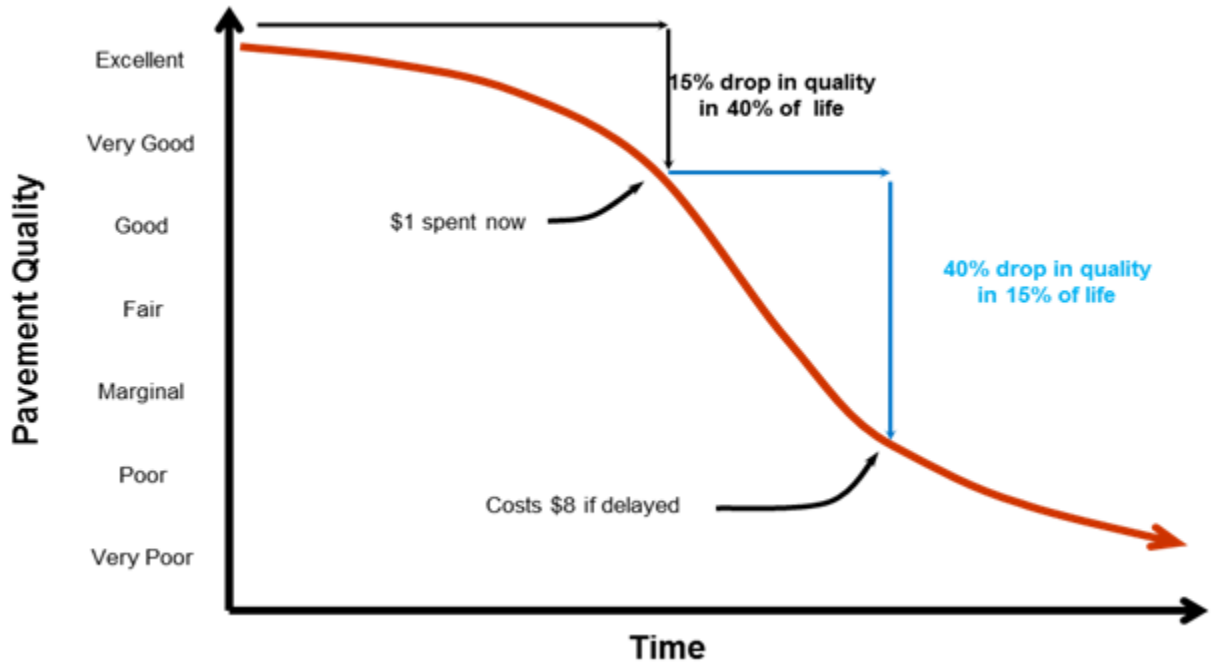

Figure 2 – Pavement Deterioration and Life Cycle Costs

Once implemented, an effective pavement information management system can assist agencies in developing long-term rehabilitation programs and budgets. The key is to develop policies and practices that delay the inevitable total reconstruction for as long as practical yet still remain within the target zone for cost effective rehabilitation. That is, as each roadway approaches the steep part of its deterioration curve, apply a remedy that extends the pavement life, at a minimum cost, thereby avoiding costly heavy overlays and reconstruction.

Thus, the goal of a pavement management system is to identify the optimal level of funding, timing, and to create a renewal strategy that agencies should adopt to keep their roadway network at a satisfactory level of service. Figure 3 illustrates the concept of extending pavement life through the application of timely rehabilitations.

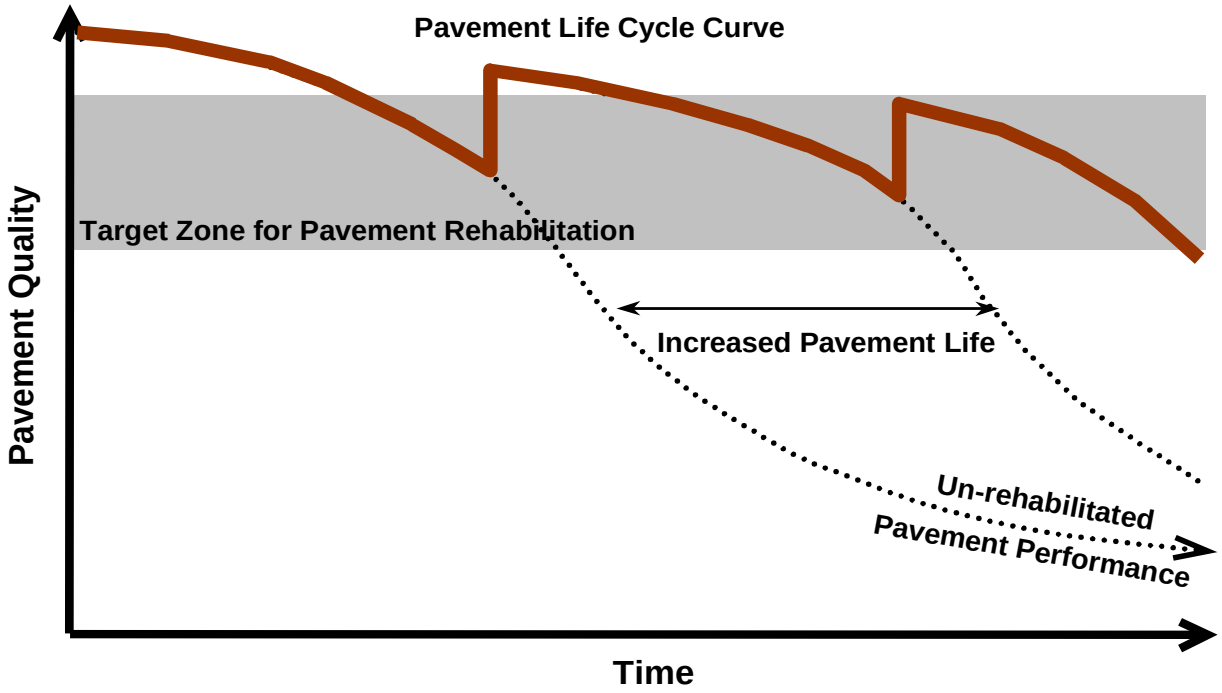

Figure 3 – Pavement Life Cycle Curve

Ideally, the lower limit of the target zone shown in Figure 3 would have a minimum PCI value in the 60 to 70 range to keep as many streets as possible requiring a thin overlay or less. The upper limit would tend to fall close to the higher end of the Very Good category – that is a pavement condition score approaching 85. Other functions of a pavement management system include assessing the effectiveness of maintenance activities, new technologies, and storing historical data and images.

For Huntsville, a prioritization methodology based on pavement condition, pavement materials, condition, and strength rating was used to analyze the network condition and develop the proposed 5 year rehabilitation plan.

The analysis methodologies and data collection technologies were based on the latest version of *ASTM D6433 Standard Practice for Roads and Parking Lots Pavement Condition Index Surveys* (hereinafter ASTM D6433) for assessment of pavement surface condition and the International Roughness Index (IRI) for quantification of pavement roughness on all city streets. These measurements of pavement quality are combined to form an overall 0 to 100 Pavement Condition Index (PCI), with 100 being the best.

1.2 THE PAVEMENT MANAGEMENT PROCESS

The actual pavement management process involves three unique, but important steps, and is presented graphically in Figure 4. Each activity builds on the previous, until the end result is a prioritized paving and rehabilitation program.

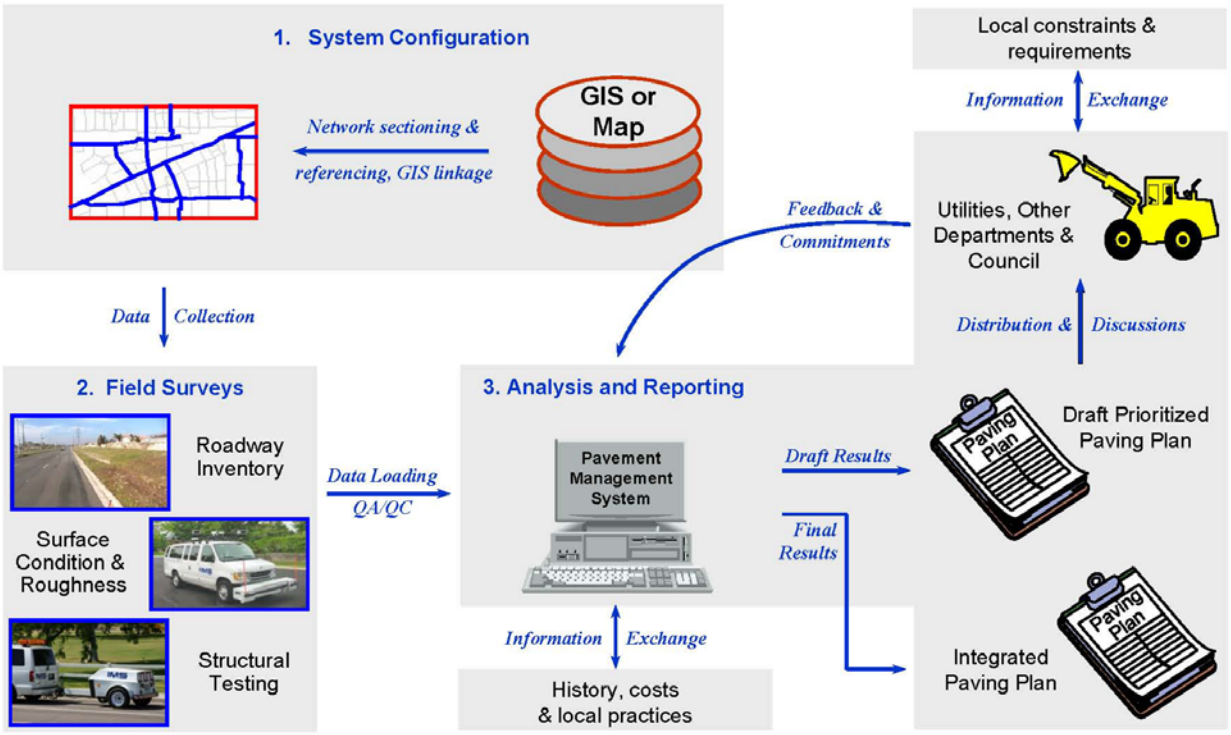

Figure 4 – The Pavement Management Process

Highlights of the pavement management process include:

1. **System Configuration** – This step involves identifying all roadways in the City's network, assigning them a unique identifier, listing their physical characteristics (length, width, etc.) and demographic attributes (pavement type, traffic, functional classification), and linking the network to the City's GIS map.

2. **Field Surveys** – Following a set of predefined assessment protocols matching the pavement management software (ASTM D6433), a specialized piece of survey equipment – referred to as a Laser Road Surface Tester (Laser RST, pictured on page 6) – is used to collect observations on the condition of the pavement surface, as well as collect digital imagery and spatial coordinate information. The Laser RST surveys each local street from end to end in a single pass, while arterial and collector roadways are completed in two passes.

   Key pavement condition data elements collected by the Laser RST include:

   - Roughness Index – Roughness is measured following the industry standard "International Roughness Index" (IRI), an open-ended score that measures the number of bumps per mile and reports the value as millimeters/meter. The IRI value is converted to a 0 to 100 score and reported as the Roughness Index (RI) as follows:

$$RI = (11.0 – 3.5 \times \ln(IRI)) \times 10$$

where ln(IRI) is the natural logarithm of IRI.

In common terms, a newer street would have a Roughness Index above 85, while one due for an overlay would be in the range 40 to 70. Failed streets typically have roughness values below 40.

- Surface Distress Index – The Laser RST collects surface distress observations based on the extent and severity of distresses encountered along the length of the roadway following ASTM D6433 protocols for asphalt and concrete pavements. The surface distress condition (cracking, potholes, raveling, and the like) is considered by the traveling public to be the most important aspect in assessing the overall pavement condition.

  Presented on a 0 to 100 scale, the Surface Distress Index (SDI) is an aggregation of the observed pavement defects. Within the SDI, not all distresses are weighted equally. Certain load associated distresses (caused by traffic loading), such as rutting or alligator cracking on asphalt streets, or divided slab on concrete streets, have a much higher impact on the surface distress index than non-load associated distresses such as raveling or patching. Even at low extents and moderate severity – less than 10% of the total area – load associated distresses can drop the SDI considerably. ASTM D6433 also has algorithms within it to correct for multiple or overlapping distresses within a segment.

  For this project, extent and severity observations were collected, processed, and loaded into the pavement management. Within the software, the following distresses, listed in order from greatest to lowest impact, are presented as a 0 to 10 rating for review and reporting:

  Alligator Cracking – Alligator cracking is quantified by the severity of the failure and number of square feet. Even at low extents, this can have a large impact on the condition score as this distress represents a failure of the underlying base materials.

  Wheel Path Rutting – Starting at a minimum depth of ¼ inch, wheel path ruts are quantified by their depth and the number of square feet encountered. Like alligator cracking, low densities of rutting can have a large impact on the final condition score.

  Longitudinal, Transverse, Block (Map), and Edge Cracks – These are quantified by their length and width. Longitudinal cracks that intertwine are the start of alligator cracking.

  Patching – Patching is quantified by the extent and quality of patches. When the majority of a roadway surface is covered by a patch, such as a large utility replacement, the rating of the patch is minimized. All potholes are rated as patches.

  Distortions – All uneven pavement surfaces such as depressions, bumps, sags, swells, heaves, and corrugations are included as distortions and are quantified by the severity and extent of the affected area.

  Raveling – Raveling is the loss of fine aggregate materials on the pavement surface and is measured by the severity and number of square feet affected.

Bleeding – Bleeding is the presence of free asphalt on the roadway surface caused by too much asphalt in the pavement or insufficient voids in the matrix. The result is a pavement surface with low skid resistance and is measured by the amount and severity of the area.

Similar distresses were collected for concrete streets including divided slab, corner breaks, joint spalling, faulting, polished aggregate, and scaling.

- Structural Index – The network of streets was not tested for structural adequacy using a Dynaflect device. Instead, the relationship between the final pavement condition score and amount of load associated distresses was analyzed. That data is then compared to what loads the road is expected to carry as well as used to develop a layer analysis to evaluate if the base materials and pavement structure are working as a single unit. The final result is a single 0 to 100 index value. Scores above a 75 indicate the pavement is structurally adequate, between a 45 and 75 indicate additional structure is required, and those below a 45 generally require replacement.

3. **Analysis and Reporting** – Following the field surveys, the condition data is assembled to create a single score representing the overall condition of the pavement. The Pavement Condition Index (PCI) is calculated as follows:

PCI = 33% Roughness Index + 67% Surface Distress Index

Development of the pavement management plan and budgets were completed using Huntsville-specific rehabilitation strategies, unit rates, priorities, and pavement performance curves. The process was iterative in its attempt to obtain the greatest efficiency and cost benefit.

Figure 5 – Laser Road Surface Tester (Laser RST)

1.3 FUNCTIONAL CLASS REVIEW

As part of the scope of this assignment, the functional classification designations currently used by the City were reviewed for their suitability in the pavement management analysis. There is no uniform standard for functional classification designation used by municipalities in the nation or within any given state. Assignment of functional classifications is left to the individual municipalities. The Federal Highway Administration (FHWA), American Public Works Association (APWA) and Institute of Transportation Engineers (ITE) offer some broad guidelines on how to assign classifications that were followed in this study. The City's functional classification definitions used in the assessment are as follows:

1. **Primary Arterial (PART)** – All cross town corridors consisting of at least 2 to 4 lanes across, generally spaced on the ½ or ¼ mile section line (sometimes 1 mile intervals) with daily traffic counts generally 20,000 vehicles or more per day.

2. **Secondary Arterial (SART)** – Continuous and discontinuous cross town and inter-district corridors that are 2 to 4 lanes across and generally have a centerline stripe or a designated bus route. The ADT generally falls in the 5,000 to 20,000 vehicle per day range. They are typically spaced on the ½ or ¼ mile section line and on occasion, may have a short non-landscaped median. Major collectors are also assigned to street segments leading to, or adjacent to, a major traffic generator site such as a regional shopping complex.

3. **Collector (COL)** – Discontinuous inter-district corridors that are 2 lanes across and generally have a centerline stripe. The ADT generally falls in the 2,500 to 5,000 vehicle per day range. They are typically the streets that connect the residential roadways to the arterial – Major collector network.

4. **Local (LOC)** – The majority of the street segments consisting of all residential and frontage roads not defined above.

Alleys and bicycle paths were not included in this study even though they are part of the overall transportation network. The implication of this is that the final CIP and budget developed under this program will not cover upkeep of alleys and bicycle paths. Also, non-City owned streets were not surveyed as they are not maintained by the City.

The following figure (Figure 6) highlights the functional classifications used for the Huntsville roadway network. A full 36" by 36" version of this map is appended to this report.

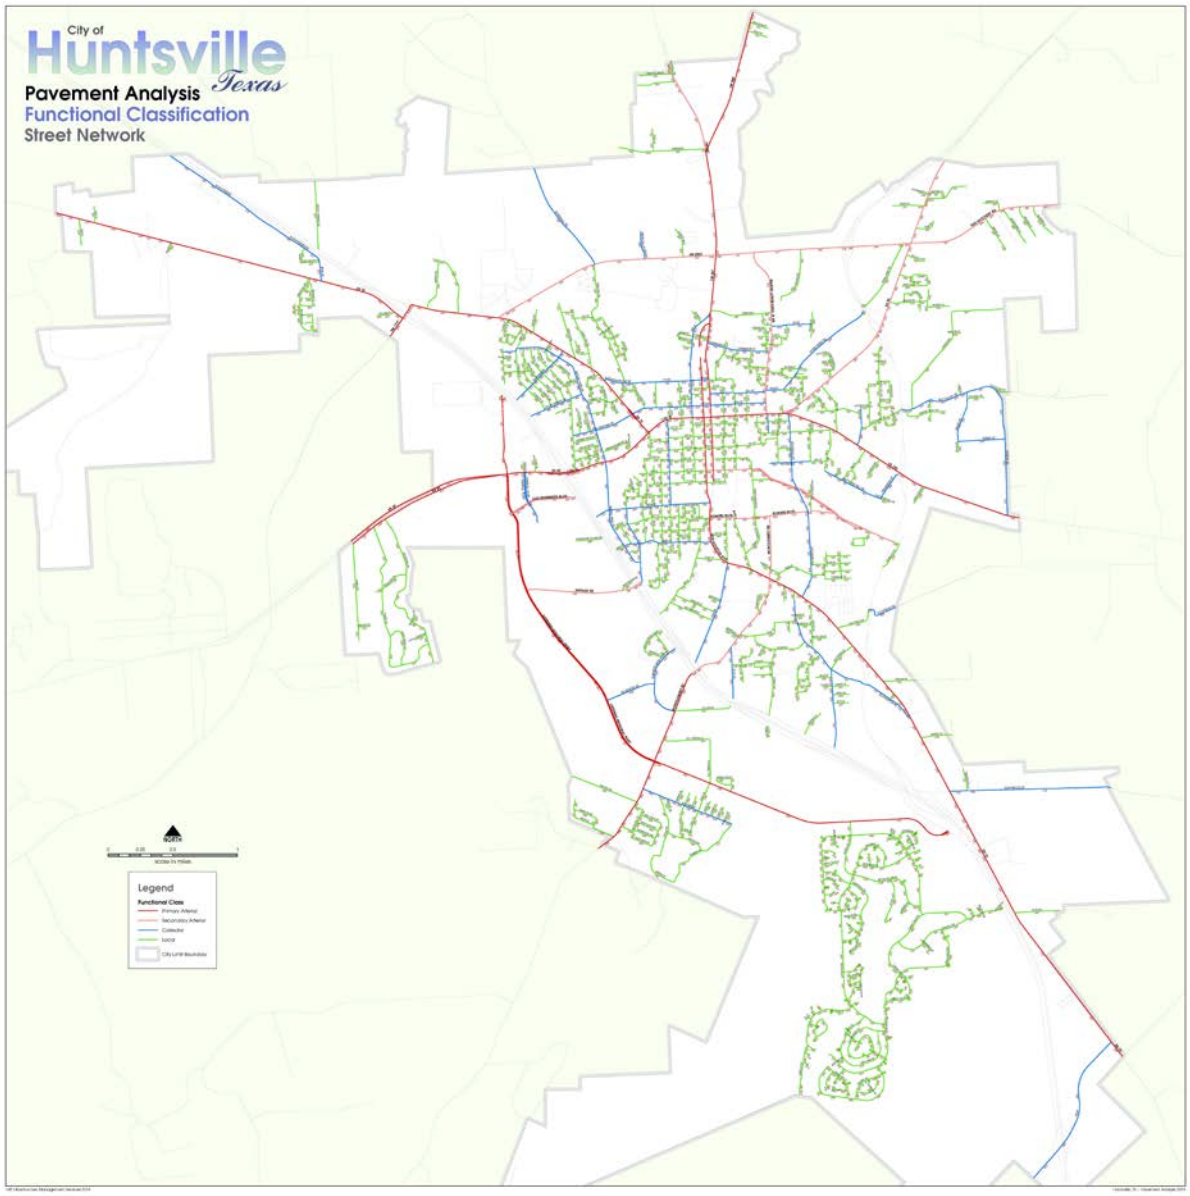

Figure 6 – Huntsville Functional Classification Designation

1.4 ASSEMBLY OF DATA AND PROJECTS (SUPERSEGMENTS)

The City's GIS was used as the basis for segmenting the roadway network on a block by block basis. Each segment was assigned a unique identifier referred to as a GISID, establishing a one-to-one relationship between the GIS and the street inventory. The segments form the basic building block of the pavement management system and are where all attribute and condition data are stored.

The centerline segments were aggregated together within the pavement management system to form logical projects that the analysis and rehabilitation program are developed against. In general:

- Arterial projects run from major intersection to major intersection.
- Similar to arterials, collector streets within a neighborhood were aggregated together to form a single project where practical.
- Local streets within a single neighborhood were aggregated together so long as their combined length was less than 1/2 mile.

Segments were joined only when the pavement condition and functional classification were homogeneous in nature such that when joined they have a relatively uniform condition that may be rehabilitated using a single strategy.

The following figure (Figure 7) highlights the projects, also referred to as "SuperSegments", used for the analysis. A full 36" by 36" version of this map is appended to this report.

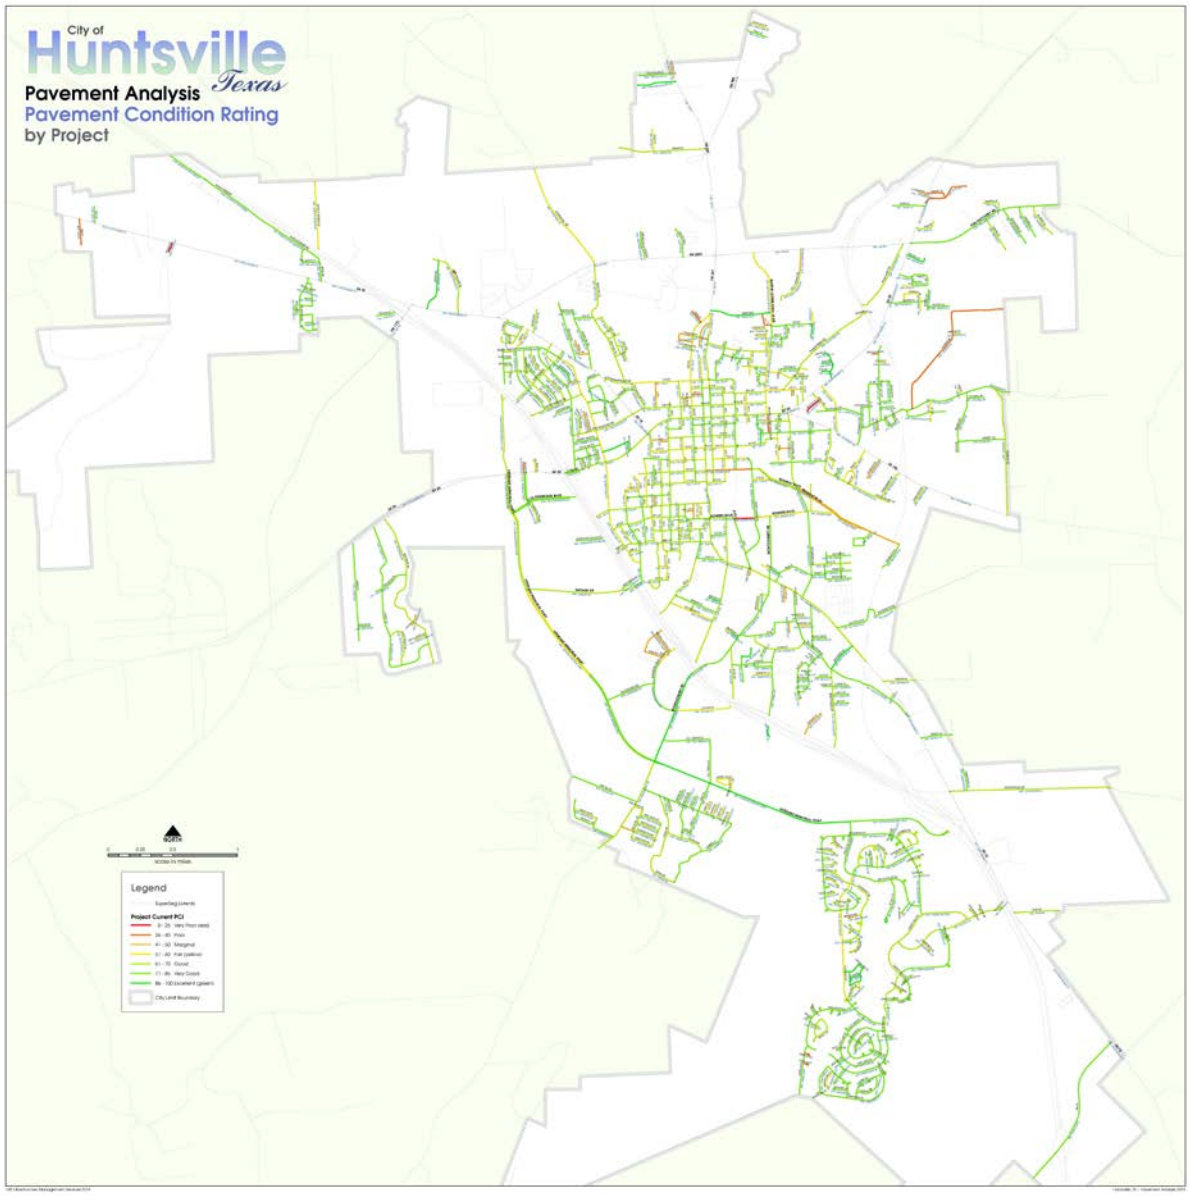

Figure 7 – Huntsville Projects (Super Segments)

1.5 UNDERSTANDING THE PAVEMENT CONDITION INDEX SCORE

The following illustration compares Pavement Condition Index (PCI) to commonly used descriptive terms. The divisions between the terms are not fixed, but are meant to reflect common perceptions of condition.

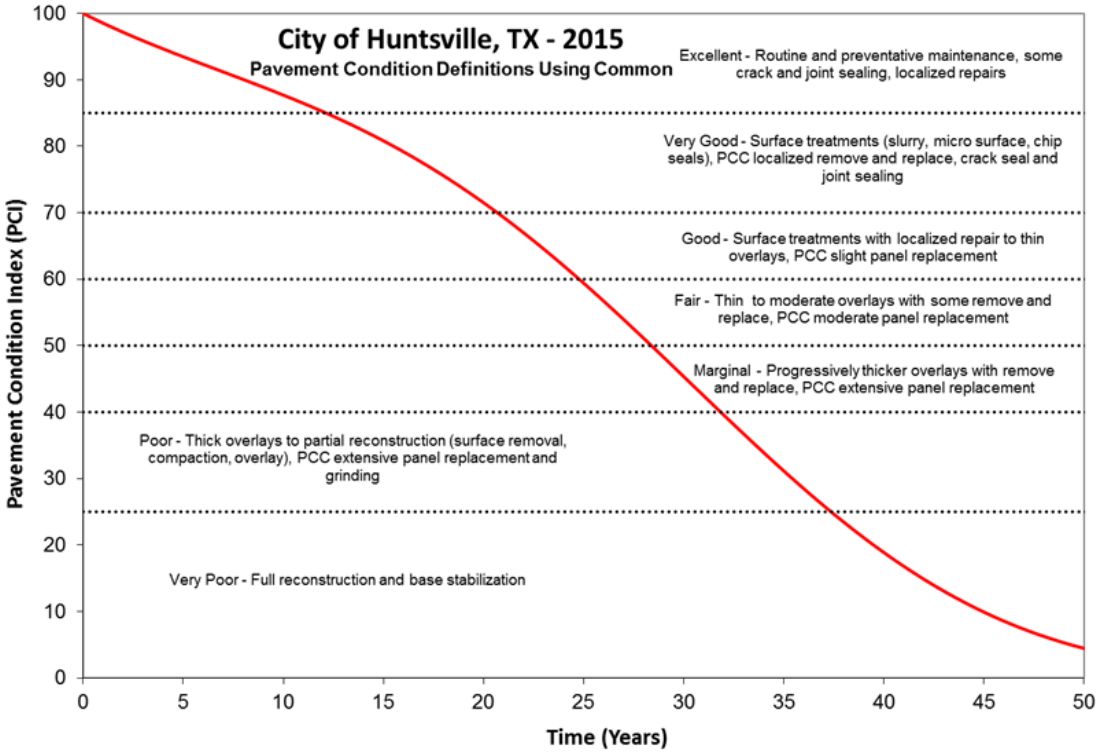

Figure 8 – Understanding the Pavement Condition Index (PCI) Score

The general idea of what these condition levels mean with respect to remaining life and typical rehabilitation actions is included in the following table:

PCI Range	Description	Relative Remaining Life	Definition
85 – 100	Excellent	15 to 25 Years	Like new condition – little to no maintenance required when new; routine maintenance such as crack and joint sealing.
70 – 85	Very Good	12 to 20 Years	Routine maintenance such as patching and crack sealing with surface treatments such as seal coats or slurries.
60 – 70	Good	10 to 15 Years	Heavier surface treatments and thin overlays. Localized panel replacements.
40 – 60	Fair to Marginal	7 to 12 Years	Heavy surface-based inlays or overlays with localized repairs. Moderate to extensive panel replacements.
25 – 40	Poor	5 to 10 Years	Sections will require very thick overlays, surface replacement, base reconstruction, and possible subgrade stabilization.
0 – 25	Very Poor	0 to 5 Years	High percentage of full reconstruction.

The images presented below provide a sampling of the Huntsville streets that fall into the various condition categories with a discussion of potential rehabilitation strategies.

Very Poor (PCI = 0 to 25) – Complete Reconstruction

Dee Lane (GISID 3142, PCI = 20) from South End to Renfro Valley Drive *– Rated as Very Poor, this street displays extensive base failure as evidenced by the severe amount of fatigue (alligator) cracking, wheel path rutting and patching. A mill and overlay on this street would not be suitable as the base has failed and would not meet an extended service life of at least 15 years.*

Deferral of reconstruction of streets rated as Very Poor will not cause a substantial decrease in pavement quality as the streets have passed the opportunity for overlay-based strategies. Due to the high cost of reconstruction, Very Poor streets are often deferred until full funding is available in favor of completing more streets that can be rehabilitated at lower costs, resulting in a greater net benefit to the City. This strategy however must be sensitive to citizen complaints forcing the street to be selected earlier. In addition, this type of street can pose a safety hazard for motorists, since severe potholes and distortions may develop. It is important to consistently monitor these streets and check for potholes or other structural deficiencies until the street is rebuilt.

Poor (PCI = 25 to 40) – Last Opportunity for Surface Base Rehabilitation

Boettcher Mill Road (GISID 2974, PCI = 35) from Holly Drive to Persimmon Drive *– Rated as Poor, this segment still has some remaining life before it becomes a critical reconstruction need. On this street, the base is starting to fail extensively in the wheel paths where the drainage is poor and will continue to spread across the full width of the pavement. Some of the distresses present in this segment include linear & transverse cracking, alligator cracking, and rutting. If the drainage was repaired and the failed area dug out, a grind and overlay or partial reconstruction would return this roadway to a like new pavement. If left untreated, within a short period of time, a full reconstruction would be required. This is the worst part of this segment.*

On arterial roadways, Poor streets often require partial to full reconstruction – that is removal of the pavement surface and base down to the subgrade and rebuilding from there. On local roadways, they require removal of the pavement surface through grinding or excavation, base repairs, restoration of the curb line and drainage, and then placement of a new surface.

In general, the service life of Poor streets is such that if deferred for too long, it would require a more costly reconstruction. Streets rated as Poor are typically selected first for rehabilitation as they provide the greatest cost/benefit to the City – that is the greatest increase in life per rehabilitation dollar spent.

Marginal (PCI = 40 to 50) – Progressively Thicker Overlays, Often with Extensive Patching

Bearkat Boulevard (GISID 3130, PCI = 42) from State Highway 19 to Varsity Drive *– Marginal streets have distresses that tend to be localized and moderate in nature – that is they do not extend the full length of the segment and can be readily dug out and repaired. This street segment highlights this characteristic as the failed area does not quite extend the full length or width of the roadway and is still serviceable. However, it also highlights the relationship between base and pavement quality. Placing an overlay on this street without repairing the base would not achieve a full 15 year life as the failure would continue to occur over time.*

Similar to streets rated as Poor, Marginal streets that display high amounts of load associated distresses are selected as a priority for rehabilitation as they provide the greatest cost/benefit to the City. If left untreated, Marginal streets with high amounts of load associated distresses would deteriorate to become partial reconstruction candidates. Marginal streets that are failing due to materials issues or non-load associated failures may become suitable candidates for thick overlays if deferred without a significant cost increase.

Fair (PCI = 50 to 60) – Thin to Moderate Overlays

Avenue P (GISID 3859, PCI = 50) from 19th Street to 18th Street *– Rated in the Fair category, these streets require thin to moderate overlays for asphalt and slab replacements for concrete when they enter their need year (generally within 2-3 points of the lower PCI in the defined range). Several distresses are present, but tend to be more localized and moderate in severity, and non-load related (primarily longitudinal and transverse shrinkage cracks). On this segment of road, the signs of deterioration are evident in the center of the pavement but are low in severity indicating the base has not yet failed, a simple dig out and repair would remove the distressed areas prior to an overlay.*

Asphalt streets rated as Fair tend to receive a lower priority when developing a rehabilitation program. The reason for this is the cost to complete an overlay now would be on the order of $11 to $19/yd^2 depending on the functional classification. If deferred, the rehabilitation cost would only increase by about $3 to $6/yd^2 in about 5 to 10 years. Thus, the cost of deferral is low when compared to deferring a thick overlay to a reconstruction with a two to threefold increase in cost. Rehabilitation of concrete roads has limited options as it is difficult to complete surface-based overlays. Rehabilitation strategies tend to focus on removal and replacement of whole or partial slabs and surface grinding to restore the longitudinal profile of the roadway.

Good (PCI = 60 to 70) – Surface Treatments to Thin Overlays

University Ave (GISID 4356, PCI = 64) from University Ave to Sam Houston Ave *– Rated as Good, it displays small amounts of distresses that can easily be removed, replaced, and covered to restore the visual appearance of the roadway. The existing cracks should be sealed and the pavement seal coated, with a heavier surface treatment such as microsurfacing or double slurry to fully waterproof the pavement and cover the crack sealant. The occasional dig out and replacement may be required to correct localized deficiencies. Alternatively, depending on the extent of the distressed areas, base strength and drainage, a thin overlay may be applied.*

Streets rated as Good are ideal candidates for thinner surface-based rehabilitations and local repairs. Depending on the amount of localized failures, a thin edge mill and overlay, or possibly a surface treatment, would be a suitable rehabilitation strategy for streets rated as Good. Streets that fall in the high 60 - low 70 PCI range provide the greatest opportunity for extending pavement life at the lowest possible cost, thus applying the principals of the perpetual life cycle approach to pavement maintenance. The adjacent photo is a great example of a street segment (not a Huntsville Road) that displayed low load associated distresses and thus, high structural characteristics, and once the distressed areas were replaced, a double slurry was applied. The patching accounted for less than 5 to 10% of the total area and resulted in a good looking, watertight final surface at a much lower cost than an overlay with less disruption to the neighborhood and curb line. The patches were paver laid and roller compacted.

Very Good (PCI = 70 to 85) – Surface Treatments and Routine Maintenance

Badger Lane (GISID 3106 PCI = 84) from Shannon Drive to Shannon Drive *– Rated as Very Good, displaying minor amounts of cracking that are localized and in good condition (this is about the worst part of the street). The ride is smooth, the surface is non-weathered, and the base is still strong. This street is an example of a candidate for preventative maintenance and light weight surface treatments to extend the life of a roadway.*

Streets rated as Very Good generally need lightweight surface-based treatments such as surface seals, slurries, chip seals or microsurfacing. Routine maintenance such as crack sealing and localized repairs often precede surface treatments. The concept is to keep the cracks as waterproof as possible through crack sealing and the application of a surface treatment. By keeping water out of the base layers, the pavement life is extended without the need for thicker rehabilitations such as overlays or reconstruction. Surface treatments also tend to increase surface friction and visual appearance of the pavement surface but do not add structure or increase smoothness. Surface treatments may include:

- *Double or single application of slurry seals (slurries are a sand and asphalt cement mix)*
- *Microsurfacing – asphalt cement and up to 3/8 sand aggregate*
- *Chip seals and cape seals (Chip seal followed by a slurry)*

Additional cost benefits of early intervention include:

- *Less use of non-renewable resources through thinner rehabilitation strategies*
- *Less build-up of crown for the first and possibly second rehabilitation cycle*
- *Less intrusive rehabilitation and easier to maintain access during construction*
- *Easier to maintain existing drainage patterns*

Excellent (PCI = 85 to 100)

Montgomery Road (GISID 2806, PCI = 97) from Tall Timbers Lane to Private Road *– Rated as Excellent, displaying little to no surface distresses. The ride is smooth and the surface is non-weathered and the base is strong. In a couple of years, this street segment would be an ideal candidate for routine maintenance activities such as crack sealing.*

.

2.0 ROADWAY NETWORK CONDITION AND FINDINGS

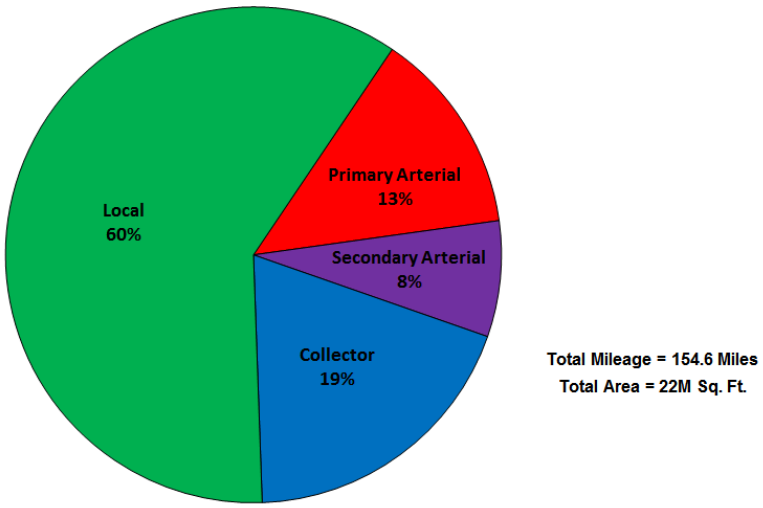

2.1 ROADWAY NETWORK SIZE

The paved roadway network consists of four functional classes, covering approximately 155 miles of pavement. The average pavement condition index (PCI) of the roadway network at the time of survey was a 69. The network has two pavement types: asphalt and concrete, with asphalt being overwhelmingly predominant. The following table and figure summarize the functional classification splits within the system.

City of Huntsville, TX
Network Summary by Functional Class

	Pavetype	Network	Primary Arterial	Secondary Arterial	Collector	Local
Segment (Block) Count	All Streets	1517	101	102	252	1062
Length (ft)	All Streets	818,500	78,269	54,508	153,439	532,283
Length (mi)	All Streets	155.0	14.8	10.3	29.1	100.8
Average Width (ft)	All Streets	27	34	34	29	25
Area (yd2)	All Streets	2,455,049	299,610	203,356	488,047	1,464,036
Pavement Condition Index (PCI)	All Streets	69	70	64	69	70
Backlog (%)	All Streets	2				
Surface Distress Index (SDI)	All Streets	71	67	61	70	73
Roughness Index (RI)	All Streets	66	75	69	66	63
Structural Index (SI)	All Streets	59	57	53	58	60

Figure 9 – Functional Classification Distribution

2.2 NETWORK PRESENT CONDITION

Figure 10 presented below shows distribution of pavement condition for the roadway network in Huntsville on a 0 to 100 scale, 0 being the worst and 100 being the best condition. The average PCI for the network is currently 69. While direct comparisons to other agencies is difficult due to variances in ratings systems, overall, Huntsville is slightly above agencies recently surveyed by IMS which typically fall in the 60 to 65 range.

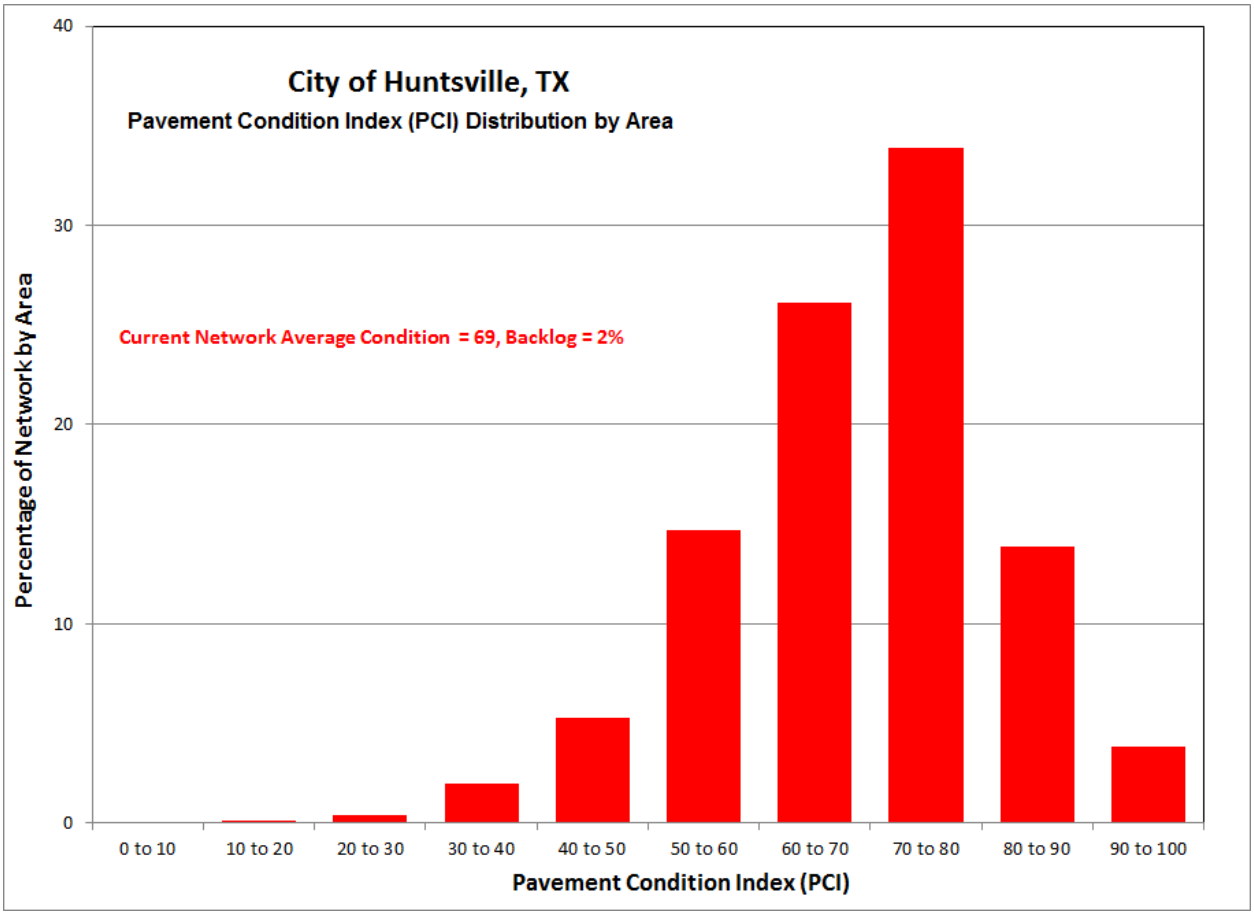

Figure 10 – Roadway Network Present Status

This is reflective of a roadway network that is relatively young with most streets just approaching their first major rehabilitation cycle. Many streets have undergone routine, but sometimes deferred maintenance, such that only a few have totally failed. It is apparent from the current distribution profile, with its predominant skew to the left coupled with a relatively small percentage below a score of 50, the City has placed an emphasis on its roadway network and has invested in its ongoing renewal. A typical distribution would be more of a bell curve centered on the 50 to 80 range.

The following graph (Figure 11) plots the same pavement condition information, but instead of using the actual Pavement Condition Index (PCI) value, descriptive terms are used to classify the roadways. From the chart, eight percent (8%) of the network can be considered in Excellent condition with a PCI score greater than 85. These streets are in like new condition and require only routine maintenance.

Nationwide, the amount of roadways falling into the Excellent category is about fifteen percent (15%), so this value is below the average and indicating the rehabilitation process is just starting to occur.

Forty-four percent (44%) of the network falls into the Very Good classification. These are roads that benefit most from preventative maintenance techniques such as microsurfacing, slurry seals and localized repairs. If left untreated, these roadways will drop in quality to become heavy surface treatment or overlay candidates.

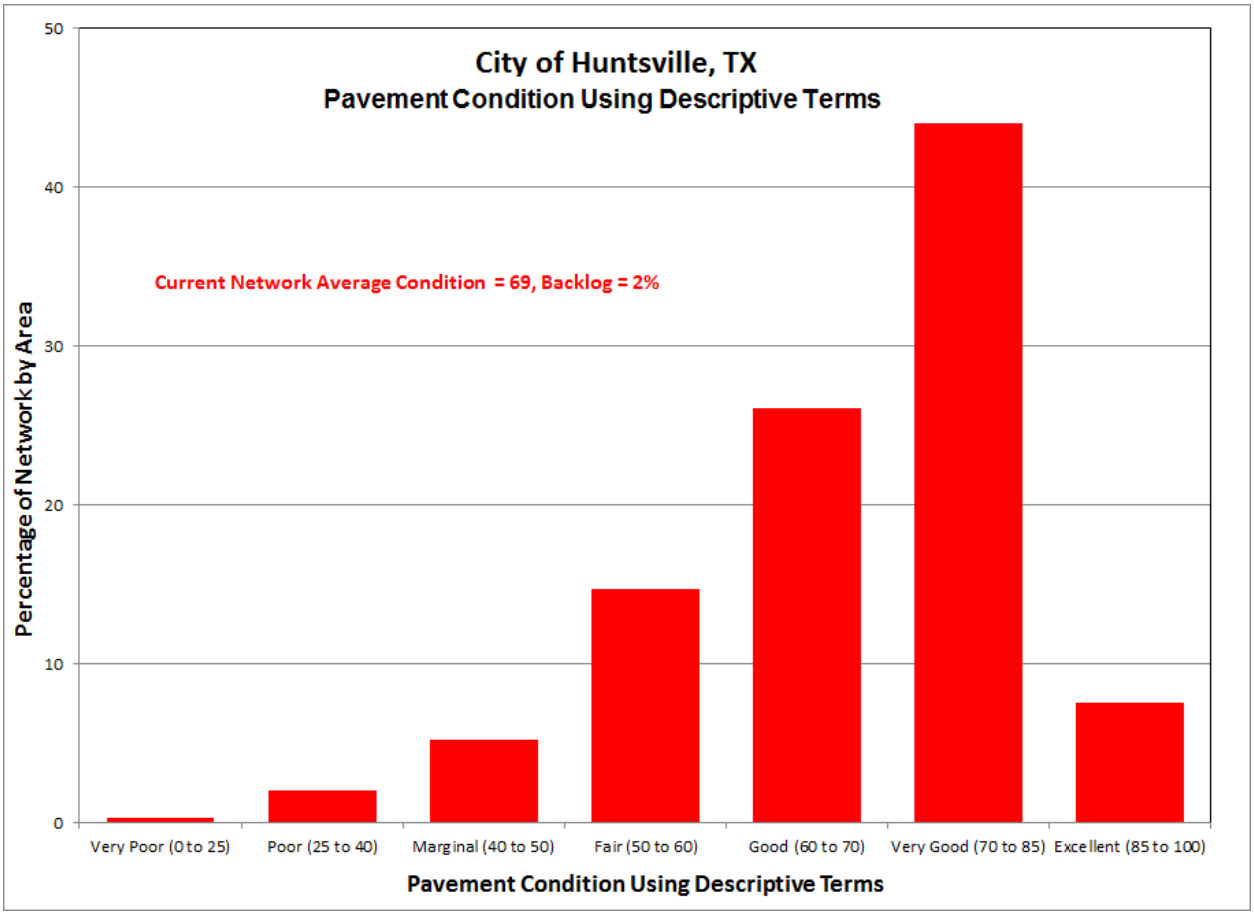

Figure 11 – Roadway Network Present Status Using Descriptive Terms

Twenty-six percent (26%) of the streets are rated as Good and are candidates for lighter surface-based rehabilitations such as heavy microsurfacing or thin overlays. Twenty percent (20%) of the network can be considered in Fair to Marginal condition, representing candidates for progressively thicker overlay-based rehabilitation or panel replacements. If left untreated, they will decline rapidly into reconstruction candidates. The remaining 2% of the network (backlog) is rated as Poor or Very Poor, meaning these roadways have failed or are past their optimal due point for overlay or surface-based rehabilitation and may require progressively heavier or thicker forms of rehabilitation (such as surface reconstruction or deep patch and paving) or total reconstruction.

Figures 12 and 13 present the surveyed condition of the streets using PCI and descriptive terms, respectively. A full 36" by 36" version of these maps are appended to this report.

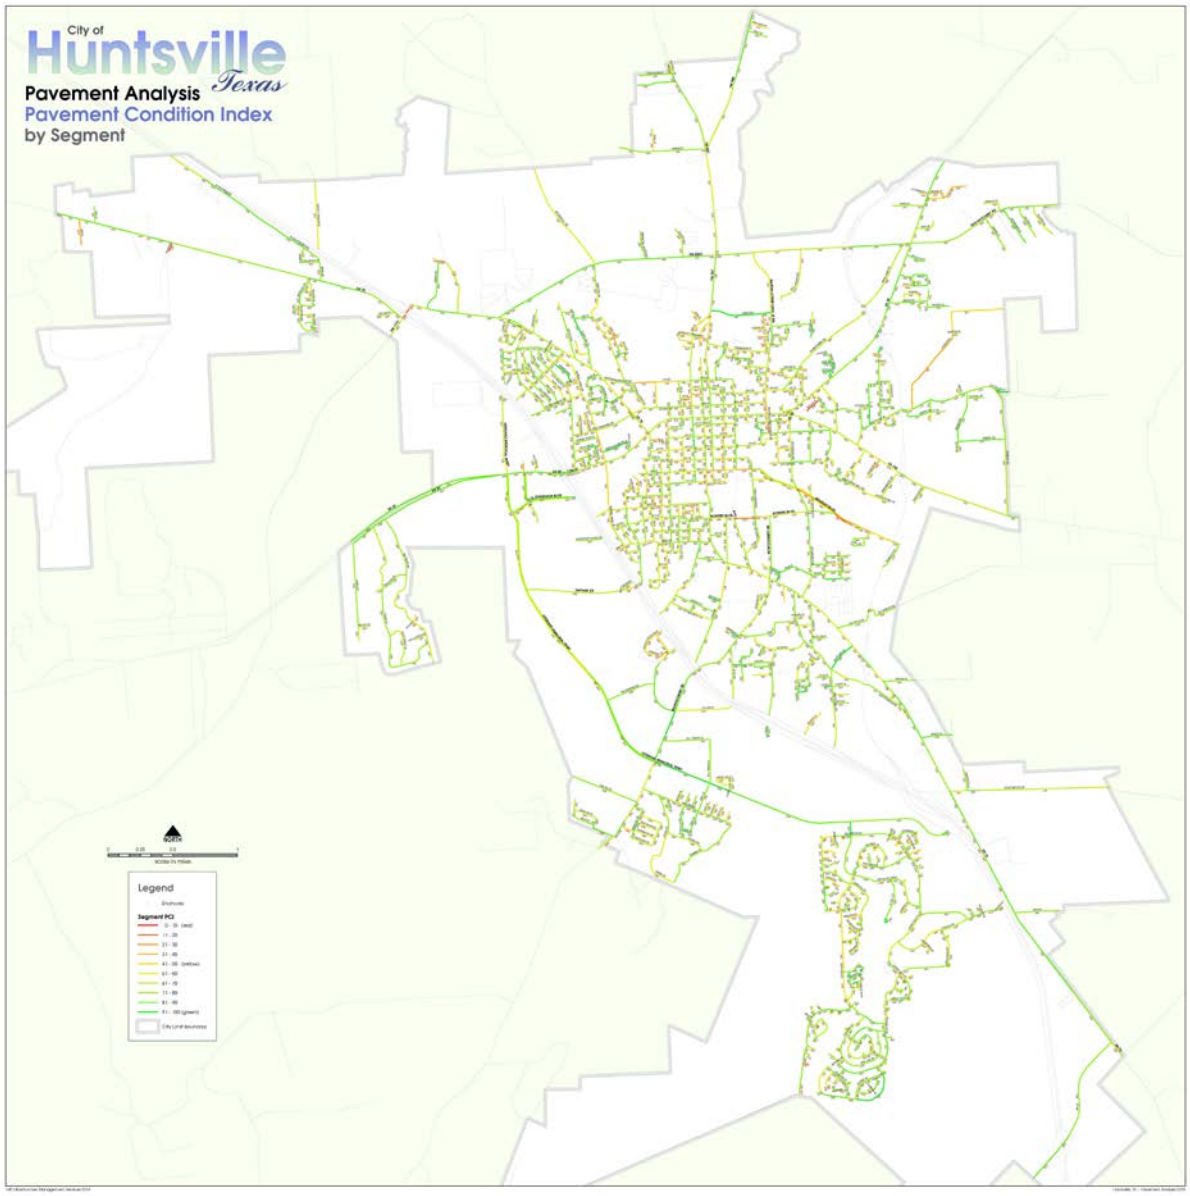

Figure 12 – Huntsville Pavement Condition by Segment using PCI

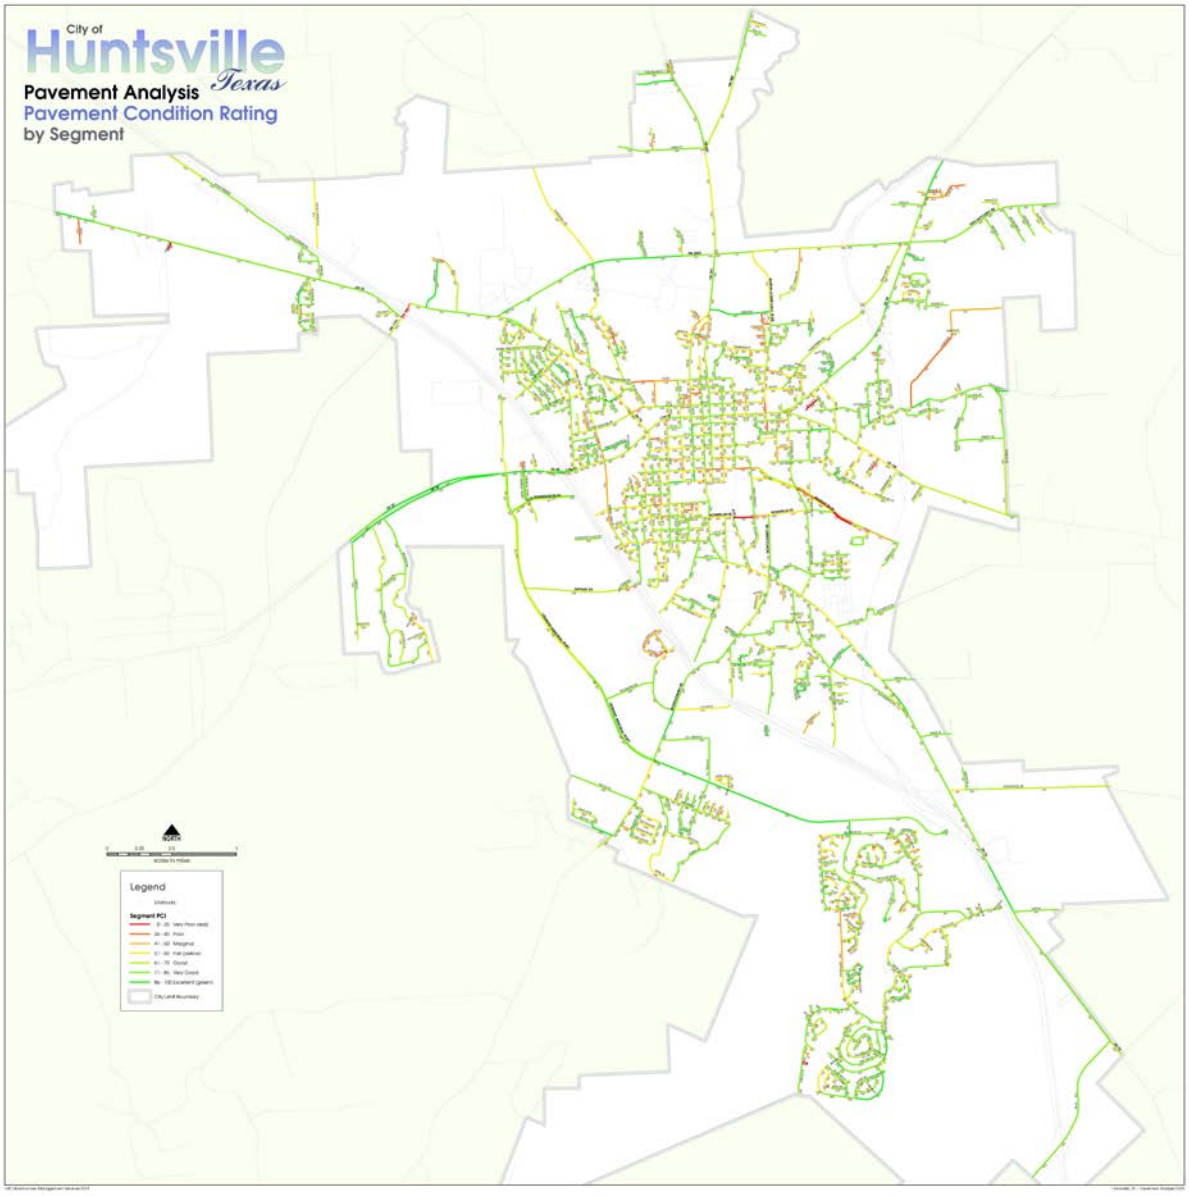

Figure 13 – Huntsville Pavement Condition by Segment Using Descriptive Terms

The role of the street network as a factor in the City's well-being cannot be understated. In simplest of terms, roadways form the economic backbone of a community. They provide the means for goods to be exchanged, commerce to flourish, and commercial enterprises to generate revenue. As such, they are an investment to be maintained.

The overall condition of an agency's infrastructure and transportation network is a key indicator of economic prosperity. Roadway networks in general are one of the most important and dynamic sectors in the global economy, having a strong influence on not only the economic well-being of a community, but a strong impact on quality of life. Well-maintained road networks experience multiple socioeconomic benefits through greater labor market opportunities and decreasing income gap. As a crucial link between producers and their markets, quality road networks ensure straightforward access to goods and drive global and local economies. Likewise, higher network quality has a strong correlation to improvements in household consumption and income. Roads also act as a key element to social cohesion by acting as a median for integration of bordering regions (Gertler). This social integration promotes a decreased gap in income along with diversity and a greater sense of community that can play a large role in decreasing rates of poverty (Amparo).

On the flip side, deterioration of roads can have adverse effects on a community and may bring about important and unanticipated welfare effects that the governments should be aware of when cutting transportation budgets (Gertler). Poor road conditions increase fuel and tire consumption while shortening intervals between vehicle repair and maintenance. In turn, these roads result in delayed or more expensive deliveries for businesses and consumers (Economic Dependence on Good Roads). Economic effects of poor road networks, such as time consuming and costly rehabilitation, can be reduced if a proactive maintenance approach is successfully implemented.

Overall, Huntsville has a solid network foundation. The majority of the network falls under the Fair to Very Good categories, while the amount of Poor and Very Poor streets are minimal. Both of these performance measurements indicate a relatively healthy pavement network. Furthermore, Huntsville has a centerline mileage that is somewhat proportional to its current population. When the centerline mileage is out of proportion to the current population, an increased burden is placed on rate payers to maintain the network. The following plot (Figure 14) presents a comparison of population versus centerline mileage of several recent surveys. As can be seen, Huntsville falls just below the trend line for centerline mileage.

The primary concern for the long term health of Huntsville's roadway network from a pavement management perspective is to ensure that the backlog does not grow excessively over time. By maintaining the backlog at its current rate, the City can save itself thousands of dollars by preventing roadway failure.

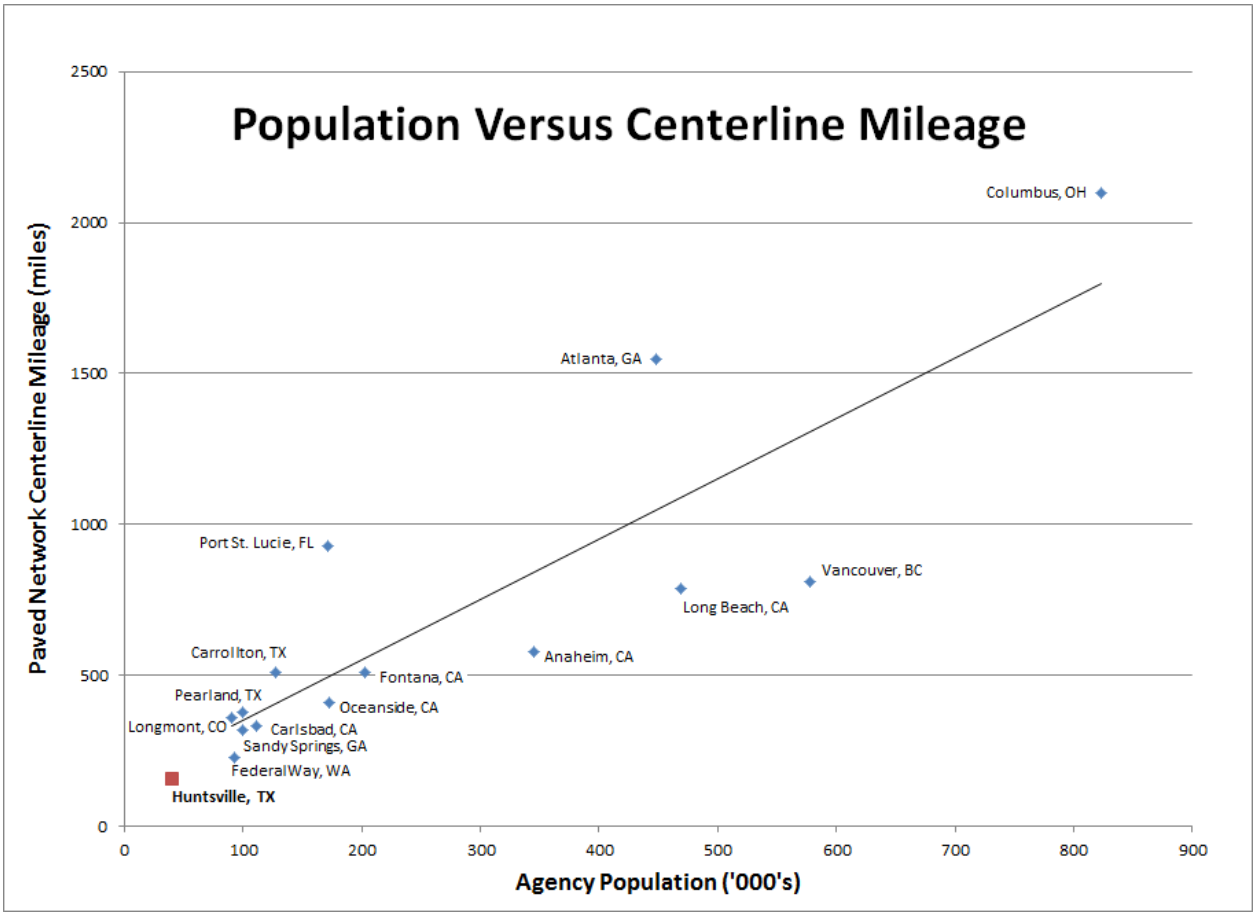

Figure 14 – Agency Population versus Centerline Mileage

2.3 STRUCTURAL AND LOAD ASSOCIATED DISTRESS ANALYSIS

Structural testing and analysis was not performed for the city of Huntsville. Instead, analysis of the cause of pavement failure for these street segments was completed by examining the types of distresses that have caused the PCI score to drop.

The structural adequacy of a road is expressed as a 0 to 100 score with several key ranges: roadways with a Structural Index greater than 75 are deemed to be structurally adequate for the loading and may be treated with lightweight surface treatments or thin overlays; those between 45 and 75 typically reflect roads that require additional pavement thickness; and scores below 45 typically require reconstruction and/or increased base and pavement thickness. It should be noted that two segments can have similar PCI values yet have differing subgrade ratings based on their testing results. Once they enter the rehabilitation planning, the Structural Index value would also ensure a thicker overlay or additional localized repairs are applied to the street segment with the lower SI score.

Surface distresses may be categorized into two classifications – load associated distresses (LAD) and non-load associated distresses (NLAD). Load associated distresses are those that are directly related to traffic loading and structural capacity. Non-load associated distresses are those that result from materials or environmental issues including shrinkage (transverse) cracking, bleeding and raveling. Generally, load associated distresses affect the overall condition score more than non-load associated distresses – as is

the case in Huntsville. For asphalt streets, roadways are classified as Weak (rated as a 30), Moderate, (rated as a 60) or Strong (rated as an 80).

The purpose of the structural analysis is twofold:

- The structural index provides input into which performance curve each segment is to use – performance curves are used to predict pavement deterioration over time.
- Structural analysis assists in rehabilitation selection by constraining inadequate pavement sections from receiving too light of a rehabilitation and conversely, identifying segments suitable for lighter weight treatment.

The primary area of concern is the street segments that have a high pavement condition score (greater than 75), yet exhibit low structural characteristics (weak to moderate pavement strengths). When an overlay is to be applied, project level testing and design should be completed to ensure their structural integrity is restored. The second area of concern is the shortened pavement life due to low structural capacity – these are segments with a lower Structural Index score than PCI score. The cause of this issue can generally be traced back to three primary sources:

- Incorporation of streets into the network that were never designed to carry heavy loads resulting in premature failure. This is common in rapidly expanding agencies who annex lighter weight county roads.
- Too thin of structural cross section and overlays – this is often caused by the use of standard designs that simply result in inadequate structural capacities. A firm understanding of subgrade and base conditions combined with a qualified structural design typically results in a thicker cross section being specified, but increases the pavement life considerably.
- Increase traffic loading beyond initial design limits, combined with ever-increasing truck weights and tire pressures. Heavier garbage and recycling trucks, along with increased transit bus size can dramatically alter pavement quality in a very short period of time.

Figure 15 plots the relationship of the load associated distresses (shown in red) and non-load associated distress (shown in blue) against pavement condition. As can be seen from the plot, at higher PCI scores, it is the non-load associated distresses that have a higher concentration of deducts over the load associated distresses. As the PCI score drops, the load associated distresses typically affect the PCI score to a higher degree. This is indicative of a network that has good pavement performance for the first half of a street's life, and then suffers from progressive structural or base failures over time. High PCI score (above 60) rehab selections should focus on pavement preservation activities such as surface treatments or thin overlays, possibly with some localized pavement repairs and crack sealing.

The upper black diagonal line identifies segments that have a high ratio of load associated distresses compared to their PCI score and are defined as weak and have a structural index of 30 assigned to them. The lower black diagonal line identifies segments that have a low ratio of load associated distresses compared to their PCI score and are defined as strong with a structural index of 80. In between the two lines, and all segments with a PCI > 80 are assigned a moderate pavement strength and structural index of 60.

The sum of the Load-Associated Distress (LAD) deducts is also used to qualify the appropriate rehabilitation strategy selection in addition to the overall pavement condition score. For example, a street

that has a good PCI score (that is between 60 and 70) and is displaying relatively low load associated distress deducts would be a suitable candidate for a surface treatment in place of a thin overlay in that the PCI score is more influenced by materials issues such as transverse cracking or raveling.

On the local network, the high amounts of streets exhibiting weak performance is related to poor subgrade conditions, pavement thickness and increased traffic loading – in particular heavy, side-loading garbage and recycling trucks (an unintended consequence of green initiatives). On a recent study completed by IMS for the City of Longview, WA, garbage and recycle trucks account for approximately 33% to 50% of the pavement damage done to a local street, yet represent only a fraction of the traffic. The reason for this imbalance is that local streets were never designed for heavy garbage or recycle trucks and cannot effectively withstand the structural loading – often following the same wheel path.

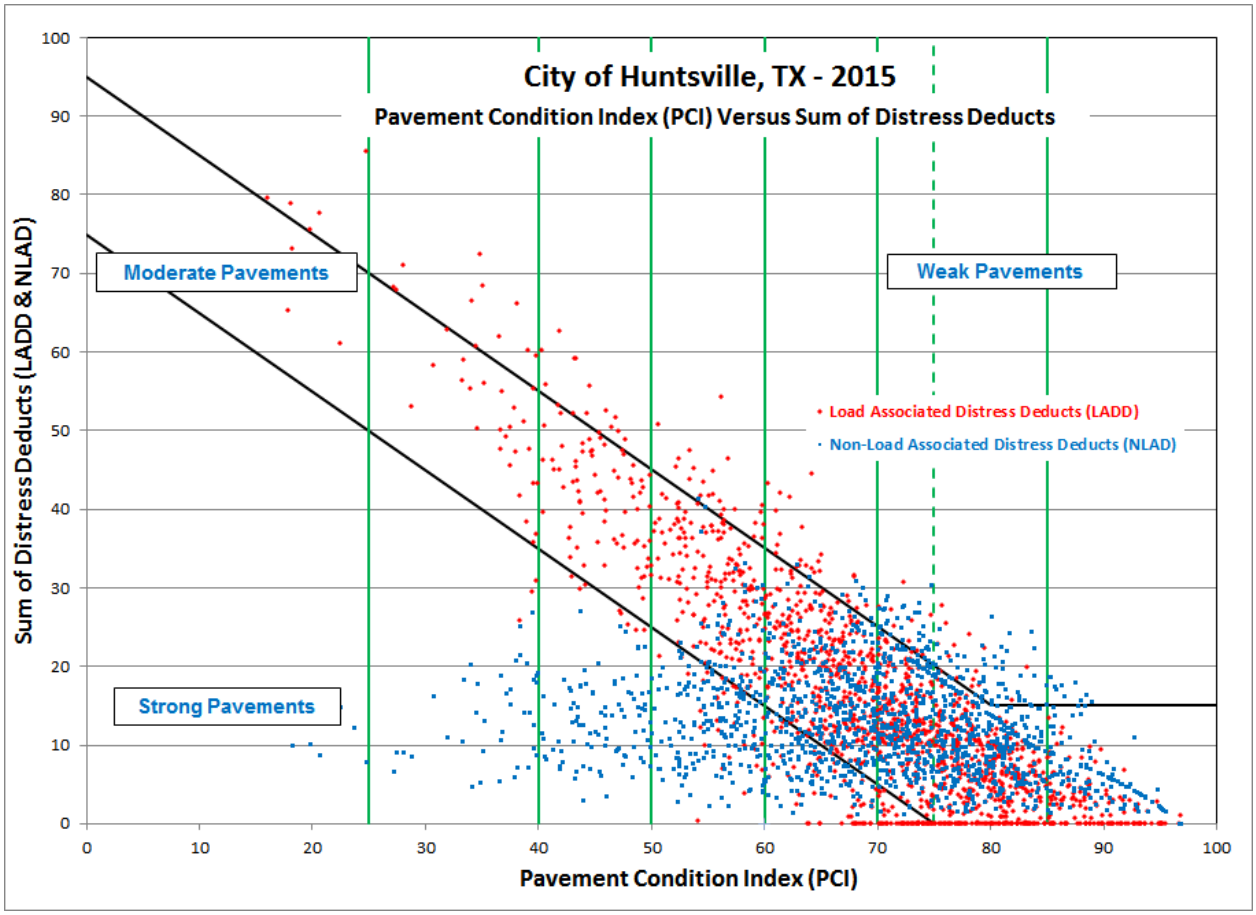

Figure 15 – Pavement Condition Index versus Sum of Distress Deducts

2.4 EVALUATING QUALITY OF THE NETWORK AND RECONSTRUCTION BACKLOG

The concept of the Pavement Condition Index (PCI) score, backlog percentage and number of streets rated as Excellent must be fully understood in order to understand and develop an effective pavement management program. These three metrics should fall into certain ranges in order to measure the quality and long term viability of a network.

The PCI score indicates the overall pavement condition and represents the amount of equity in the system; it is the value most commonly considered when gauging the overall quality of a roadway network. It may also be used to define a desired level of service: that is, an agency may wish to develop a pavement management program such that in five years the overall network score meets a set minimum value. Obviously, the higher the PCI score the better off the overall network condition is. Agencies with an average PCI score above 80 (when considering surface distress, roughness and strength) are rare and found only in a few select communities. Less than 1 in 20 communities surveyed by IMS have that high of a condition average. Averages between 65 and 80 are indicative of either newer networks, or ones that have an ongoing pavement rehabilitation program and tend to be fully funded. Scores between 60 and 65 are common and represent a reasonable average providing a satisfactory balance between levels of service and funding, and when taken with the other two metrics may represent a well-managed and funded network. A minimum score of 60 means that overall the network falls at the lower end of the range where light weight surface treatments and thin overlays are the standard rehabilitation practice. Below a 60 means an agency has to rely on more costly rehabilitations and reconstructions to address condition issues.

At the upper end of the condition scale, a minimum of 15% of the network should be rated as Excellent. Generally, at or above 15%, means that a noticeable percentage of the roadway network is in like new condition, requiring only routine maintenance. While higher percentages of streets rated as Excellent are certainly desirable, the annual cost to maintain this rate is often cost prohibitive. Below 15%, means the agency is struggling to effectively rehabilitate their network on an annual basis.

Backlog roadways are those that have dropped sufficiently in quality to the point where surface based rehabilitation efforts would no longer prove to be cost effective. These roadways are rated Poor or Very Poor and will require either partial or total reconstruction. Backlog is expressed as the percentage of roads requiring reconstruction as compared to the network totals.

It is the backlog, however, that defines the amount of legacy work an agency is facing and is willing to accept in the future. It is the combination of the three metrics that presents the true picture of the condition of a roadway network, and conversely defines improvement goals.

Generally, a backlog of 10% to 15% of the overall network is considered manageable from a funding point of view with 12% being a realistic target. Backlog rates below 10%, again are certainly desirable, but financially unachievable for a large percentage of agencies. Backlogs approaching 20% or more tend to become unmanageable, unless aggressively checked through larger rehabilitation programs, and will grow at an alarming rate. At about 20% backlog, the rate of decrease in average condition, and hence growth in backlog, exceeds most agencies ability to arrest the decline and address the large volumes of streets in need of rehabilitation. Basically, at 20% a tipping point has been met and the backlog tends to increase faster than an agency's ability to reconstruct their streets.

Huntsville's average pavement condition score fell slightly above the recommended target zone of 60 to 65. The number of streets rated as Excellent fell slightly below the minimum target of 15%. The backlog amount was well below recommended target of 12%.

3.0 REHABILITATION PLAN AND BUDGET DEVELOPMENT

3.1 KEY ANALYSIS SET POINTS

Pavement management systems (PMS) require user inputs in order to complete its condition forecasting and prioritization. The existing PMS operating parameters were reviewed in order to develop an efficient program that is tailored to the City's needs. Some of the highlights include:

- The pavement performance curves that are used to predict future pavement condition reflect the recent work done on the system through the introduction of strength rating – as streets are upgraded, the ratio of pavement condition to load associated distresses improves and the street performs better for longer periods of time. Asphalt streets are classified as weak, moderate or strong, and then assigned the appropriate pavement performance curve to use in the analysis. The concept of load associated distresses does not apply to concrete streets.
- The shape of performance curves reflect the concept of deferred maintenance and salvage life. Instead of dropping to an absolute PCI value of 0 after 40 years of service, the curves are designed to become asymptotic to the age axis and have a whole life of approximately 35 to 60 years depending on pavement type. This indicates the concept that once a street deteriorates past a specific threshold – about a PCI of 20, age becomes less important in rehab selection.
- Priority ranking – analysis uses prioritization for rehab candidate selection. It is designed to capture as many segments in their need year based on the incremental cost of deferral. The higher the functional classification of a street, the higher priority a segment is given.

Pavement Performance Curves

The basic shape of the asphalt performance curves follows traditional sigmoidal deterioration models such as those contained in MicroPAVER and other commonly used pavement management applications. The curves are constructed such that a typical overlay following new pavement construction does not occur until 20 to 30 years have passed, and full reconstruction does not occur until 40 to 65 years have passed or the street has a PCI below 10. Each street is assigned a curve based on its pavement type, functional classification, and pavement strength as determined in Section 2. The curves assume an ultimate life between 60 and 75 years and are designed to be asymptotic to the X-axis (Time) to reflect the salvage value of the pavement once it has reached the end of its service life with a PCI less than 10.

It is important to recognize that even though all streets fall into specific rating categories (as highlighted by the horizontal black dotted lines in Figure 16) and their respective rehabilitation strategies, it is not until a street falls to within a few points of the lower end of the range that it will become a critical need selected for rehabilitation.

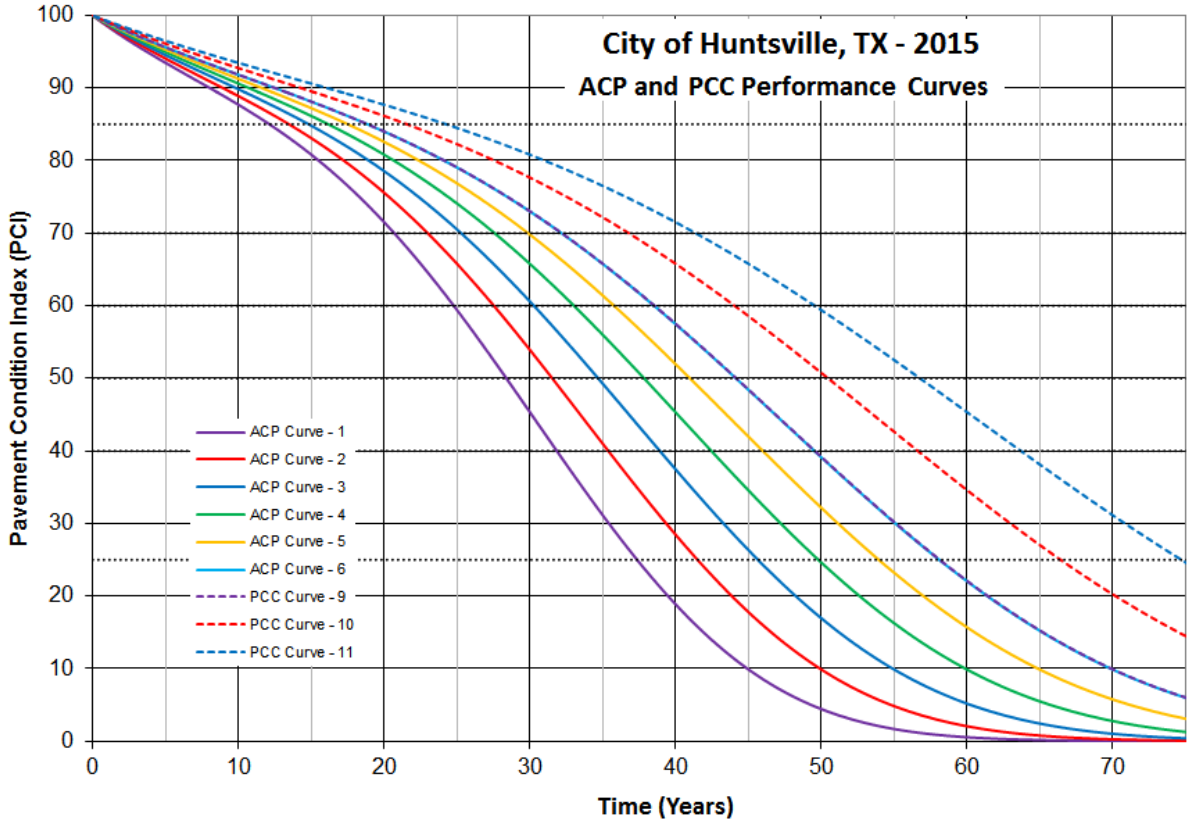

Figure 16 – Asphalt (ACP) Performance Curves

Rehabilitation Strategies and Unit Rates

The rehab strategies and unit rates used in the pavement analysis can be found in the following table. Some important parameters include:

- **Rehab Code and Activity** – The assigned identifier and name to each rehabilitation strategy. The term "RR" refers to remove and replace – that is, structural patching. When this term is present, additional funds have been assigned to the strategy to allow for an increased amount of preparation work and patching. The relative terms of thin, moderate and thick are used to describe the overlay thickness. This is to facilitate consistency in the naming convention, but does not imply the same material thickness has to be used for each functional classification.
- **Unit Rates** – The rehab costs are presented on a per square yard basis for each pavement type, functional class, and rehab activity combination. The rates were developed using typical national averages for similar activities and adjusted for Huntsville's location and unique conditions. Rates include a 25% burden for miscellaneous activities (such as striping removal or loop detector replacement), traffic control and engineering inspection. No money has been set aside for contingency, ADA compliance or City overheads.

- **Min PCI, Critical PCI, Max PCI, and PCI Reset** – These define the Pavement Condition Index (PCI) and Structural Index range applicable to the rehab selection. The Critical PCI defines when a segment is in its need year and is deemed to be critical, otherwise if deferred, the street declines in PCI past the point which the rehabilitation is no longer appropriate. PCI Reset is the applied Post-Rehab PCI.

Pavetype	Rehab Code	Rehab Activity	Min PCI	B/P PCI	Max PCI	PART Unit Rate ($/yd2)	SART Unit Rate ($/yd2)	COL Unit Rate ($/yd2)	LOC Unit Rate ($/yd2)	FunCL 5 Unit Rate ($/yd2)	FunCL 6 Unit Rate ($/yd2)	Burden (%)	Reset PCI
	5	Routine Maintenance	75	77	85	0.00	0.00	0.00	0.00	0.00	0.00	0.0

Figure 17 graphically presents the application of pavement rehabilitations for asphalt streets by PCI and the Structural Index as determined by the Load Associated Distress Deducts of the roadway network. The Rehab numbers are simply placeholders to separate one rehabilitation from another (for example Rehab 43 is an Edge Mill + Moderate Overlay with RR). The analysis starts by selecting all critical segments in the first priority rehabilitation, (in this case Rehab ID 56 – Thick Overlay +RR2), that have the highest priority weighting. If there is money remaining, it moves to Selection Sequence 2 (Rehab ID 53 – Thick Overlay +RR1), and so on. If all critical streets have been selected and there is money remaining in the budget, the process is repeated selecting non-critical segments.

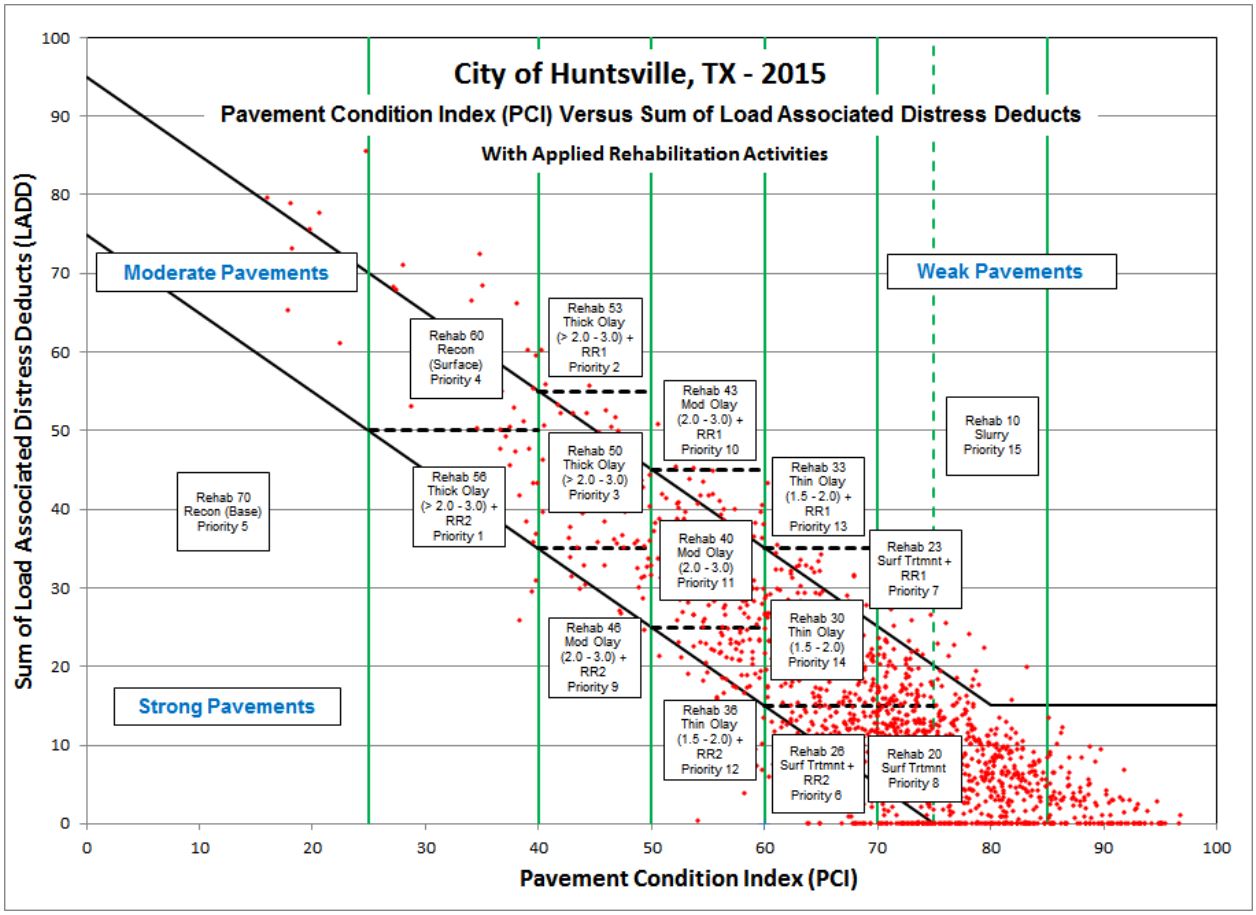

Figure 17 – Asphalt (ACP) Rehabilitation Strategies

Assigned Priority

The pavement management analysis incorporates a series of user-defined factors to prioritize the selection of rehabilitation candidates. The factors include the condition score, pavement strength, functional class and whether a segment is in its need year or may be deferred until critical. Once combined into a single value, the assigned priority is integrated with the rehab strategies to effectively select candidates that offer the greatest cost benefit for pavement maintenance based on the incremental cost of deferral.

The following plot (Figure 18) presents the assigned priority (the higher the priority the more likely hood of being selected for rehabilitation) for a single functional class. Each functional class has its own priority chart, but all are very similar in layout and function. The assigned priority methodology for Huntsville generally selects thick overlays that are in their need year first (strategies 50 through 56), followed by partial and full reconstruction (rehabs 60 and 70), then surface treatments (20 through 26). If funding is still available, moderate and thin overlays are then selected to fill up the available budget. Selection always favors higher functional class streets segments such as minor arterials and major collectors.

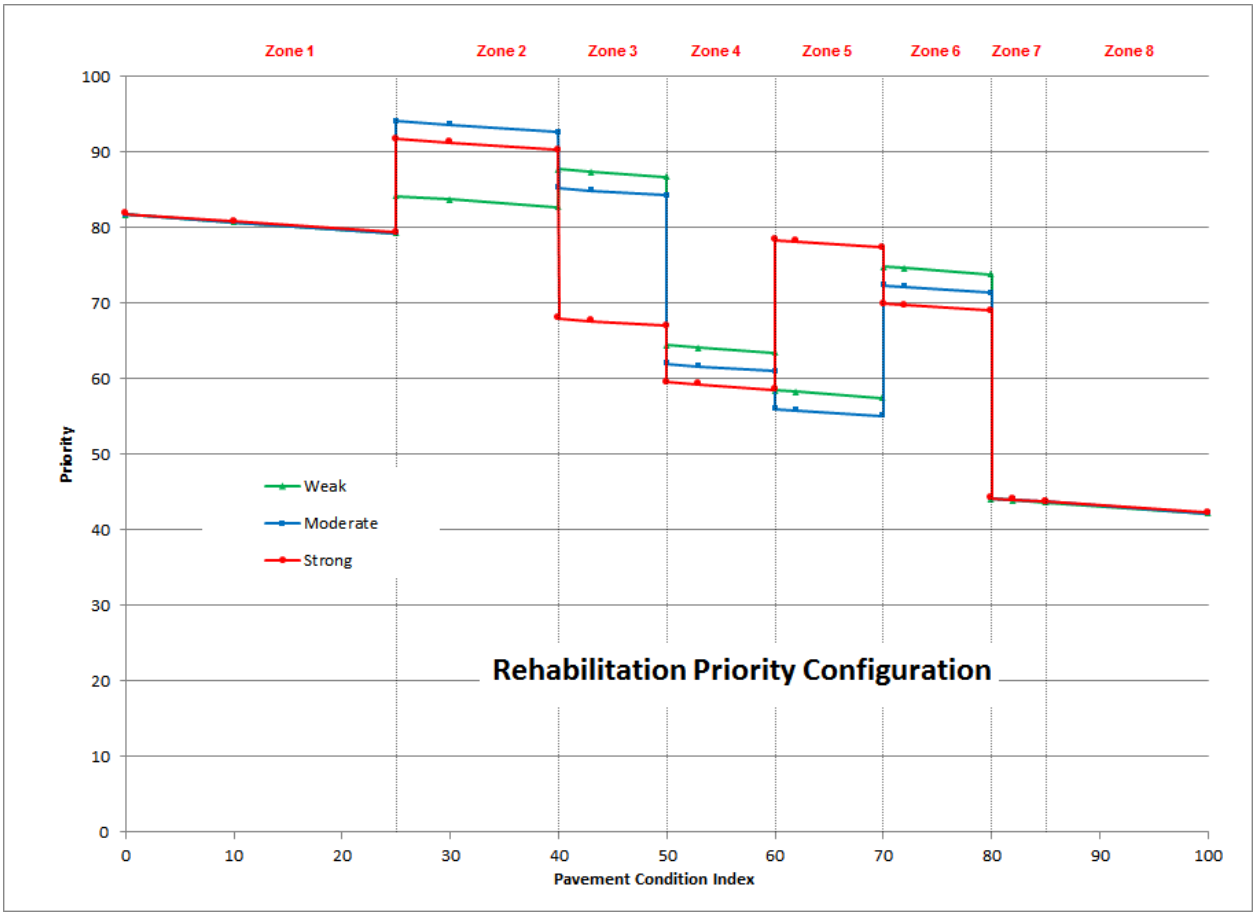

Figure 18 – Assigned Priorities

3.2 FIX ALL AND ANNUAL ESTIMATES

Three different approaches may be taken to identify and confirm the amount of funds the City needs to set aside each year to maintain the roadway network at its current condition. All three are completed externally to the pavement management system and are simply used to validate the final results.

Option 1 – Estimated Life Cycle Cost Based on Network Value

A ballpark value for the annual street maintenance budget may be quickly determined by taking the total value of Huntsville's roadway network, estimated at $120.9M, and dividing that by the ultimate life of a roadway – assumed to be 75 to 100 years for asphalt and concrete respectively (please note, the 75 to 100 year lifespan of the roadway is the theoretical life of the road from construction, until the point at which there is nothing left but the right of way, it is not simply the lifespan of the pavement surface). By this method, the annual budget is estimated at $1.58 million.

Pavement Type	Pavement Value ($)	Ultimate Life Span (yrs)	Life Cycle Annual Cost ($/yr)
Asphalt Network	111,827,000	75	1,490,000
Concrete Network	9,131,000	100	90,000
All Streets	**120,958,000**		**1,580,000**

Option 2 – Estimated Life Cycle Cost Based on Current Condition

A second method to validate the annual budget is to identify the average network PCI and associated rehabilitation requirements, and then estimate the number of miles required to be rehabilitated each year based on a typical life cycle for that rehabilitation activity. For Huntsville, the average PCI for asphalt roads is 69, which places the City in the thin overlay range, and 80 for concrete roads, which places it in the joint rehab range. At an average cost of $14.4/yd^2 for a surface treatment, and $1.55/yd^2 for joint rehab on concrete streets, the City needs to spend approximately $1.75M/year to maintain the current condition average.

Pavement Type	Pavement Condition Index (PCI)	Typical Rehab Based on Condition	Blended Rehab Unit Rate ($/yd2)	Average Rehab Life Cycle (yrs)	Miles To Do Each Year (mi)	Cost Per Mile ($/mi)	Life Cycle Annual Cost ($/yr)
Asphalt Network	68	Thin Overlay (1.5 - 2.0)	14.4	20	7.4	230,000	1,710,000
Concrete Network	80	Joint Rehab	1.55	5	1.2	30,000	40,000
All Streets							**1,750,000**

Option 3 - Estimated Life Cycle Cost Based on Network Deficiency

The third methodology to confirm the required amount of annual funding is to identify the current network deficiency, that is the amount required to rehabilitate all streets in the network assuming unlimited funding, and then divide by the typical life cycle of each rehabilitation activity. This is referred to as the Fix All Estimate and Life Cycle Cost. The rehab strategies listed in the table are generic in nature and not necessarily the final set that was applied to Huntsville. For Huntsville, the Fix All Estimate for the network deficiency is approximately $25.8M million and the Life Cycle Cost is $1.68M/year, broken down as follows:

Asphalt Deficiency	Total Cost ($)	% of Total	PART	SART	COL	LOC	Info Only STATE	Life Cycle (years)	Life Cycle Cost ($)
Reconstruction (Base)	776,100	3.1	0	370,500	0	405,600	140,100	50	15,500
Reconstruction (Surface)	2,166,600	8.6	0	650,000	463,200	1,053,400	76,100	35	62,000
Thick Olay (> 2.0 - 3.0)	2,886,300	11.5	144,200	365,300	563,000	1,813,800	121,900	20	144,700
Mod Overlay (2.0 - 3.0)	6,167,800	24.5	1,377,800	645,200	1,107,400	3,037,400	1,157,800	20	308,600
Thin Overlay (1.5 - 2.0)	8,910,500	35.4	1,739,400	607,700	2,098,500	4,464,900	1,991,600	20	446,400
Surface Treatment	2,136,600	8.5	336,200	174,800	415,500	1,210,100	399,500	10	214,600
Slurry Seal	2,063,200	8.2	202,100	112,800	487,500	1,260,800	676,100	5	412,600
Routine Maintenance	71,500	0.3	15,300	1,600	4,700	49,900	73,200	2	38,200
Total Asphalt Network:	**25,178,600**	**100**	**3,815,000**	**2,927,900**	**5,139,800**	**13,295,900**	**4,636,300**		**1,642,600**
Concrete Deficiency	**Total Cost ($)**	**% of Total**	**PART**	**SART**	**COL**	**LOC**	**STATE**	**Life Cycle (years)**	**Life Cycle Cost ($)**
PCC Reconstruction	0	0.0	0	0	0	0	0	75	0
PCC Partial Recon	263,700	41.1	0	0	0	263,700	0	50	5,300
Extensive Pnl Rplcmnt	0	0.0	0	0	0	0	0	25	0
Moderate Pnl Rplcmnt	0	0.0	0	0	0	0	0	20	0

Total Network :	**25,820,400**		**3,929,800**	**3,050,200**	**5,162,200**	**13,678,200**	**4,652,400**		**1,681,500**

3.3 NETWORK BUDGET ANALYSIS MODELS

An analysis containing a total of 6 budget runs ($550k through $2.0M per year) plus Unlimited and Do Nothing options was prepared for Huntsville.

The analysis results are summarized below:

- **Unlimited -** The Unlimited (or Fix All) budget assumes each street is rehabilitated with unlimited funds available. The idea is to identify the upper limit of spending the City would require without any constraints on budgets. For Huntsville, the unlimited budget is approximately $29M in over 5 years. This increases the network PCI to a maximum of 92 tapering off to an 88 within 5 years.
- **Do Nothing -** This option identifies the effect of spending no capital for 5 years. After 5 years, the Do Nothing option results in a PCI drop from a 67 to a 60.
- **$550k through $2.0M -** Identifies the resultant network PCI at various funding levels. From these budgets, the final recommended annual budget was determined.

The results of the analysis are summarized in Figure 19 below. The X-axis highlights the annual budget, while the Y-axis plots the 5 Year Post Rehab PCI value. The diagonal blue line is the analysis results. As can be seen from the plot, a budget of $1.525M per year (shown in red) would maintain the network at its current PCI but the backlog would increase to 4%.

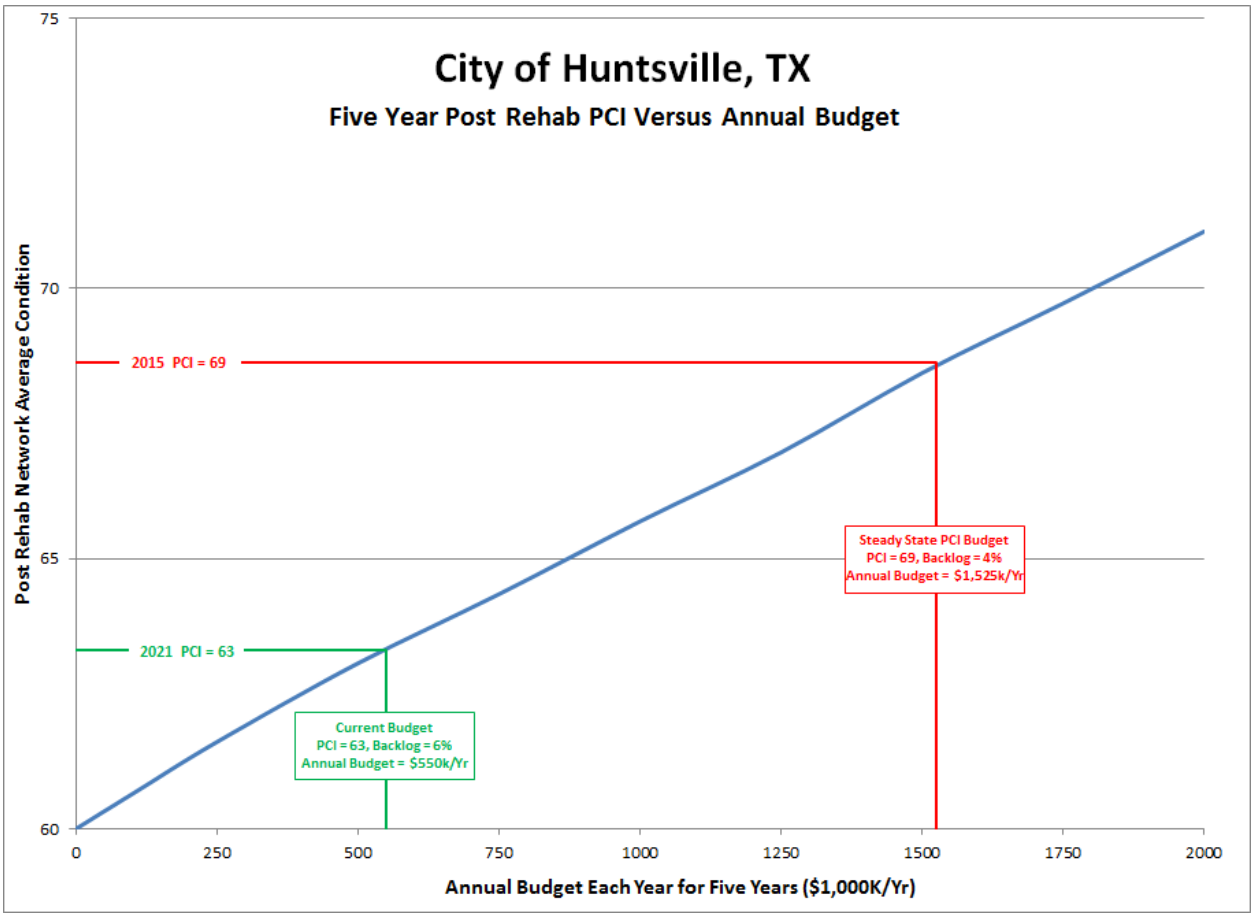

Figure 19 – 5 Year Post Rehab Network PCI Analysis Results

Figure 20 presents the resultant network backlog against annual budget. Similar to Figure 19, but instead of plotting the average PCI score, the blue diagonal line represents the total backlog after 5 years (the lower the backlog the better, with a maximum of 12% recommended). As can be seen from Figure 20, a minimum of $1.525M/year is required to control the backlog to 4% (show as the red line work and text box).

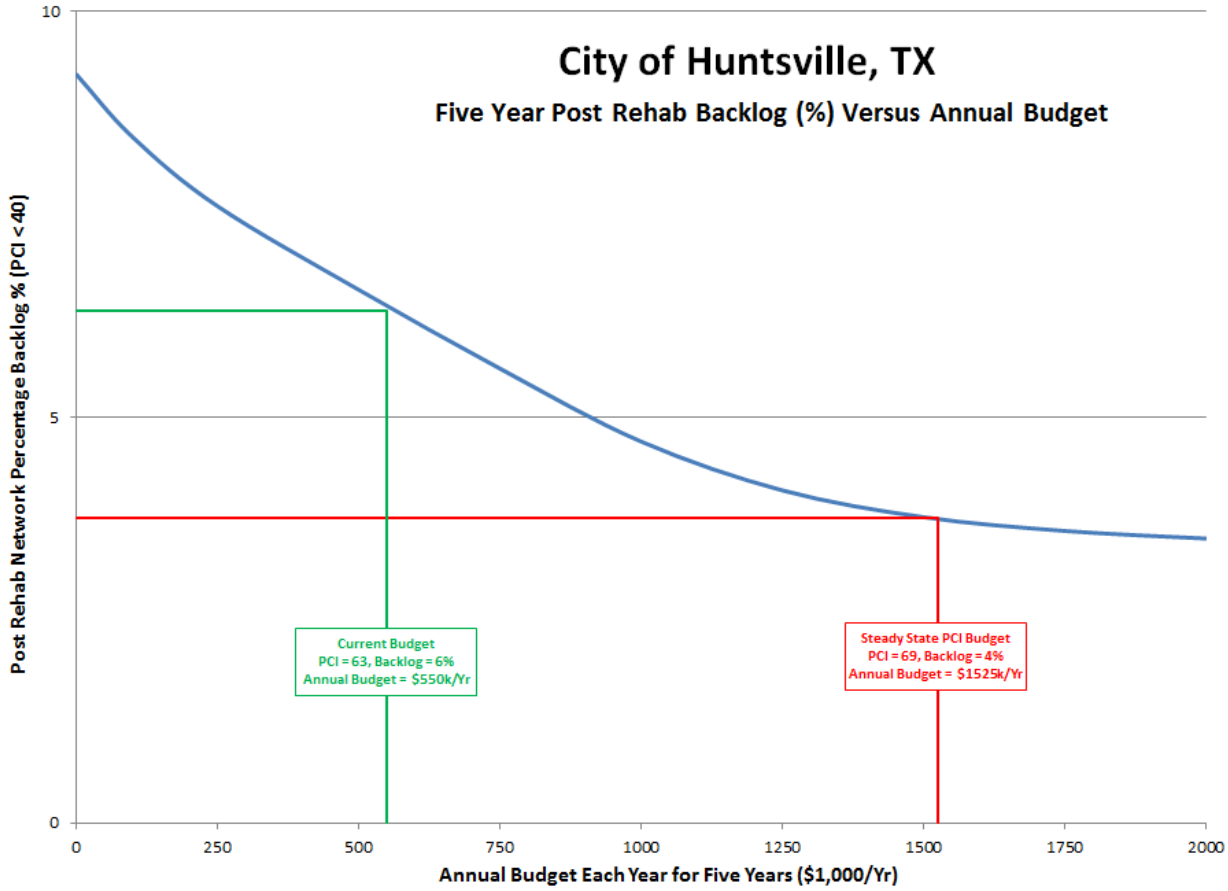

Figure 20 – 5 Year Post Rehab Network Backlog Results

Figure 21 below presents the analysis results on an annual basis. This shows that if the budget falls below $1.525M/year, over time the overall condition of the roads will deteriorate as the backlog increases.

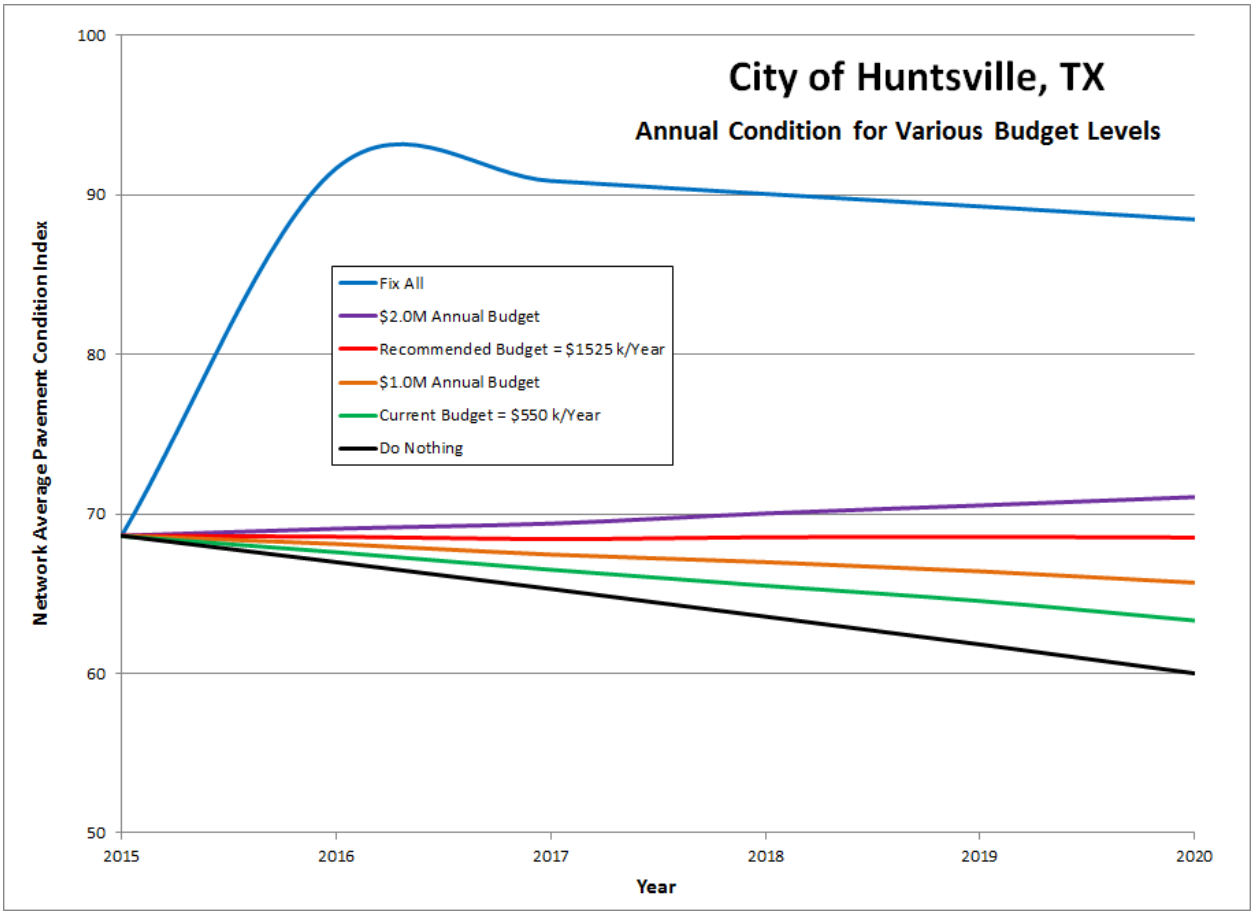

Figure 21 – 5 Year Annual PCI

3.4 HUNTSVILLE COMPARISON TO OTHER AGENCIES

The following table presents the steady state versus actual funding levels of various agencies that use similar reporting and analysis software. The list is by no means representing all agencies that use a pavement management system, but rather is a sampling of what other agencies are doing.

Agency Funding Comparison

Agency	State	Year	Mileage (mi)	PCI	Backlog	Steady State Budget ($M/yr)	Steady State Rate ($/mi)	Actual Funding ($M/yr)	Actual Funding Rate ($/mi)	Funding Ratio %	Comments
Agency CB	CA	2010	334	81	2%	3.40	10,000	3.40	10,000	100	Fully funded
Agency FW	WA	2011	231	79	4%	2.25	10,000	2.25	10,000	100	Fully funded, well structured
Agency L	NE	2012	338	77	9%	5.25	16,000	5.00	15,000	94	Slightly underfunded, majors only

Agency LB	CA	2014	786	60	21%	30.90	39,000	14.80	19,000	49	Severely Underfunded, High Backlog
Agency LC	PA	2012	102	59	15%	1.00	10,000	0.75	7,000	70	Underfunded
Agency CB	TX	2015	179	51	20%	2.00	11,000	0.50	3,000	27	Underfunded, concerning backlog

In comparison to other agencies, Huntsville's steady state budget requirement of approximately $10,000/mile is well below the sample average of $14,000. This is consistent with a smaller City network that has a PCI score being in the upper 60's.

3.5 SELECTION SUMMARY AND POST REHABILITATION CONDITION

Selecting a budget of $550k per year dedicated to roadway rehabilitation, the following table summarizes the selection results on an annual basis by the various rehabilitation strategies employed.

		Year 1 2016					Year 2 2017					Year 3 2018					Year 4 2019					Year 5 2020				
Pavetype	Rehab	Critical	Non-Critical	Selected	Length (mi)	Cost ($)	Critical	Non-Critical	Selected	Length (mi)	Cost ($)	Critical	Non-Critical	Selected	Length (mi)	Cost ($)	Critical	Non-Critical	Selected	Length (mi)	Cost ($)	Critical	Non-Critical	Selected	Length (mi)	Cost ($)

					2.9	**549,500**				**2.3**	**545,900**				**2.6**	**544,800**				**3.2**	**548,800**				**1.5**	**549,300**

Close examination of the table reveals the following observations:

- Critical thick overlays are only fully funded year 1, then the $550k/year is inadequate to overlay all the required streets and the unfunded ones become fall throughs contributing to the growth in backlog.
- A vast majority of the street labeled as critical in any given year are not being selected resulting in an overall decline of network quality.
- Between 1.5 and 3.2 miles of roadway are rehabilitated each year.

The following figure (Figure 22) compares the current network condition distribution against what the five-year post rehabilitation distribution would be at a budget of $550K/year. As can be seen in the plot, the three metrics of qualitative assessment are met at that budget level; however, it is anticipated that in years 5 through 10 a higher level of investment may be required to further control the growth in backlog.

Figure 23 and Figure 24 present the $1.525M network rehabilitation plan by year and activity, as well as how the network condition would appear on a segment by segment basis. Electronic versions of these maps are appended to this report.

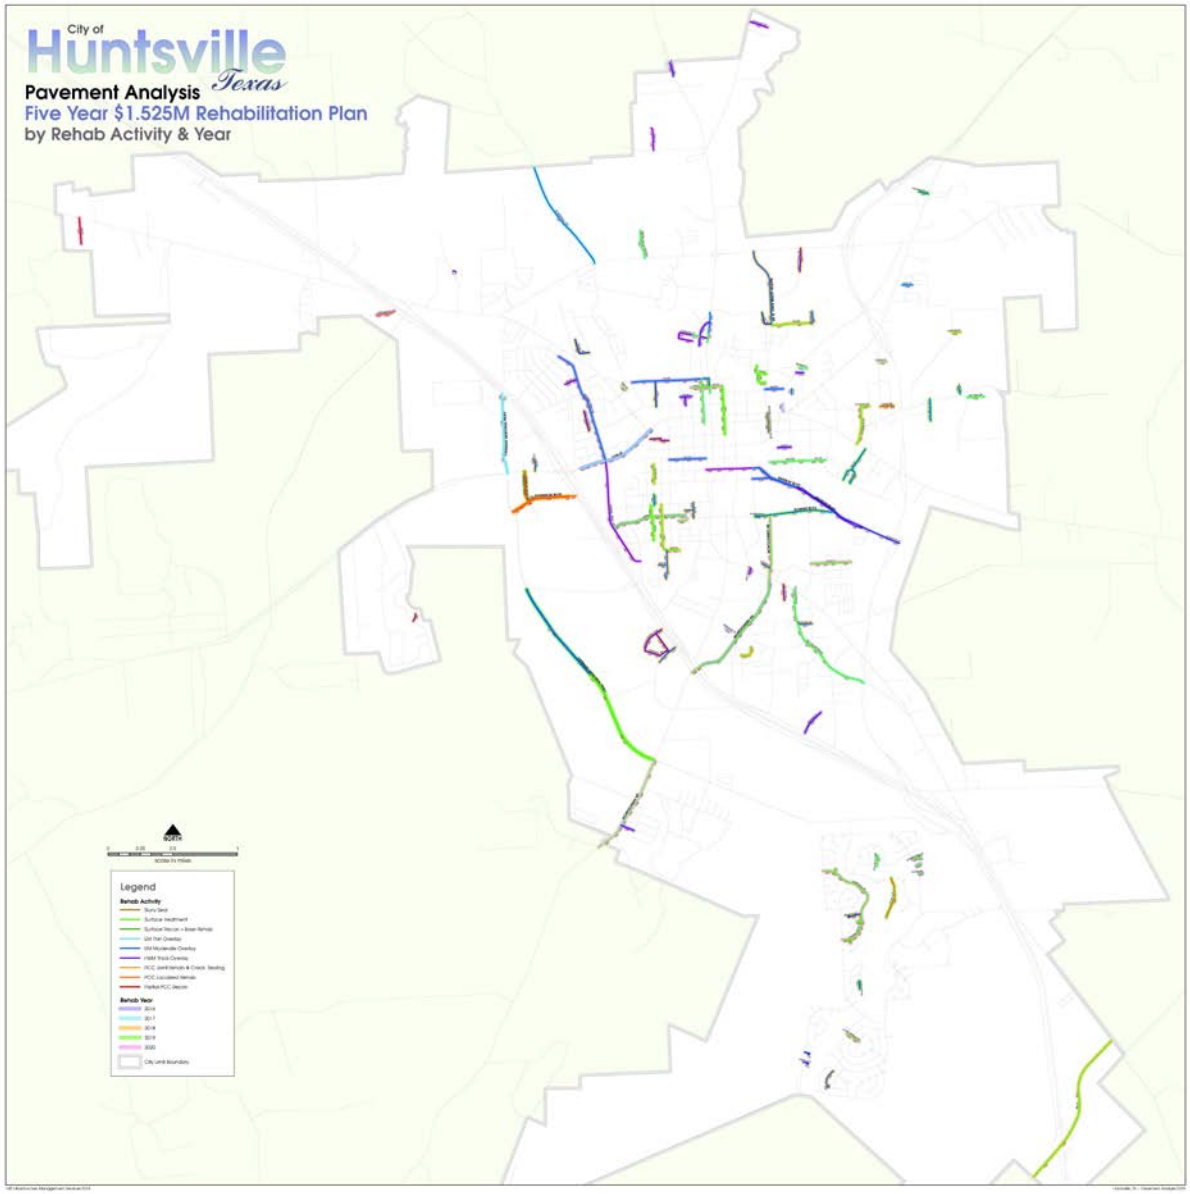

Figure 23 – Five-Year Rehabilitation Plan

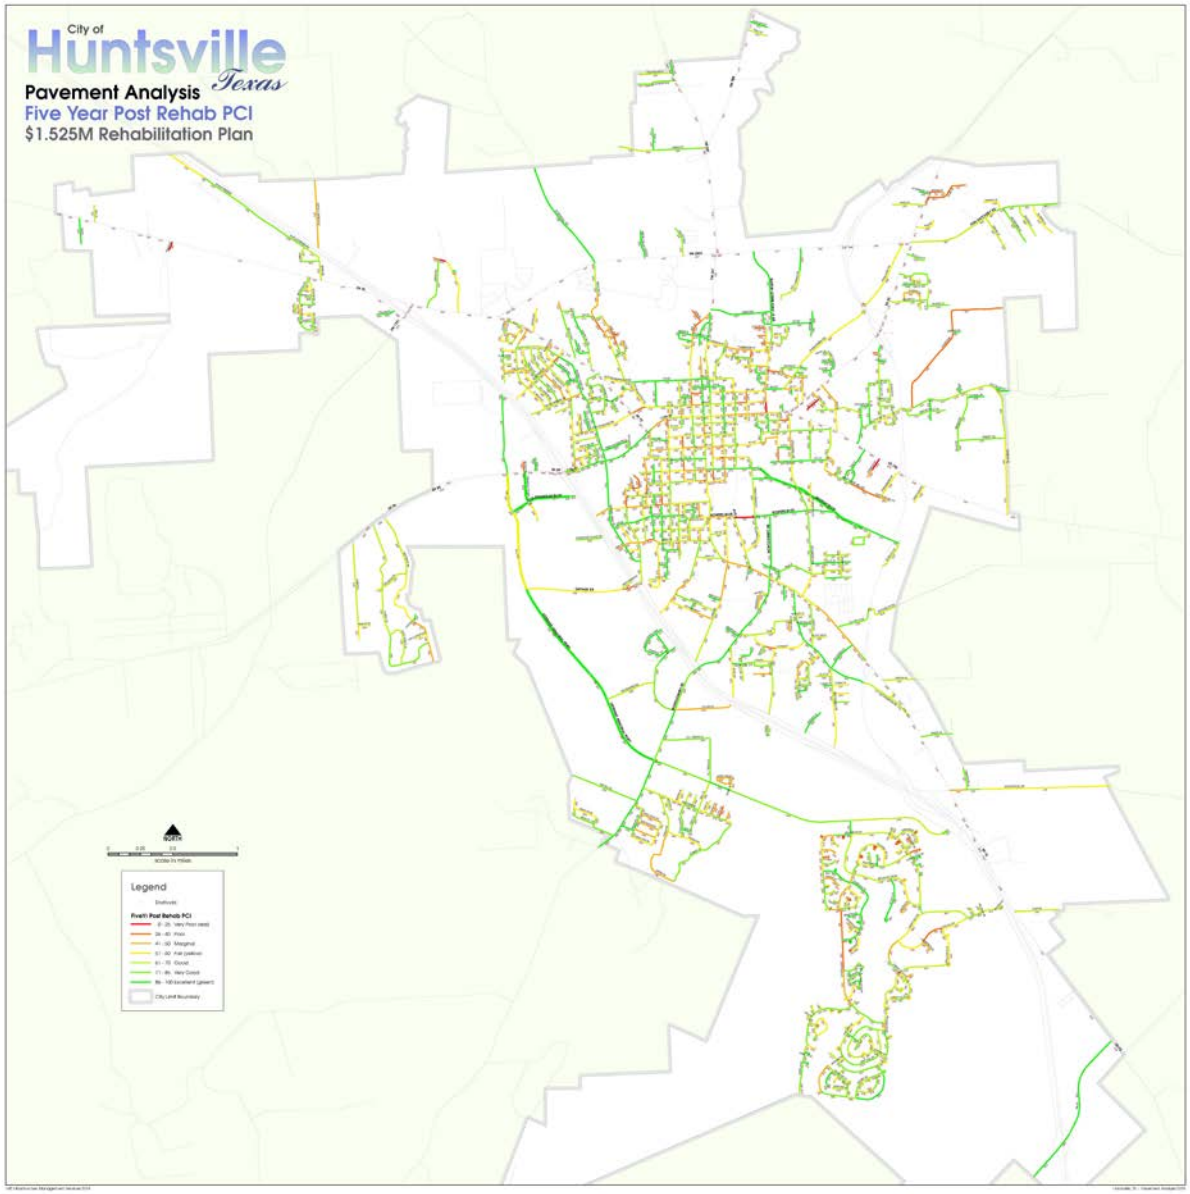

Figure 24 – Five-Year Post Rehabilitation Network Condition by Segment

3.6 NETWORK RECOMMENDATIONS AND COMMENTS

The following recommendations are presented to Huntsville as an output from the pavement analysis, and must be read in conjunction with the attached reports.

1. Huntsville should adopt a policy statement identifying the desired level of service and acceptable amount of backlog. We suggest a target that maintains the current network profile at or above a PCI of 69 for 5 years, while keeping the backlog well below 12% (anything below 10% is difficult to achieve – so a slight increase is not a worry).

   An annual budget of at least $1.525M is required to achieve this goal. The average network PCI would remain at 69 and the backlog increase slightly to 4%.

2. The full suite of proposed rehabilitation strategies and unit rates should be reviewed annually as these can have considerable effects on the final program.

3. All unit rates include a 25% burden in addition to their actual construction cost to cover traffic control, miscellaneous activities, and inspection. The unit rates have no funding for ADA compliance as these are assumed to be funded separately.

4. All costs are in constant 2015 dollars. No allowances have been made for inflation or fluctuations in rehabilitation costs.

5. No allowance has been made for network growth or conversion of gravel roadways to pavement. As the City expands or increases the amount of paved roads, increased budgets will be required.

6. No allowance has been made for routine maintenance activities such as asphalt crack sealing, sweeping, striping or patching within the budget runs and analysis. These costs are assumed to be outside the pavement management costs.

7. The City should resurvey their streets every few years to update the condition data and rehabilitation program.
